# Introduction

4D ODBC PRO is a set of 4D external routines that allows a 4D database on Macintosh or Windows to communicate with an ODBC database. Using 4D ODBC PRO, your 4D database can display, manipulate, and modify data stored in an ODBC database.

#### **About this Manual**

This manual describes how to implement, use, and modify data sources that can be accessed by ODBC with a 4D database.

The manual is written for users already familiar with the 4D language and with ODBC's SQL language. We recommend that new users familiarize themselves with both products before continuing with the manual.

#### **Cross-Platform**

This manual explains the use of 4D ODBC PRO both on the Macintosh and Windows. Although the concepts and functionality of both versions of 4D ODBC PRO are nearly identical, the manual addresses any differences where necessary. Such differences include the graphical user interface and keyboard commands.

#### 4D, 4D Server and 4D ODBC PRO

4D ODBC PRO can be used with either 4D or 4D Server. When used with 4D ODBC PRO, 4D enables you to create a database that can become a client of the ODBC data source. Each user with a copy of the database can connect to and use the ODBC database simultaneously.

4D Server allows you to create a multi-developer database application. When used with 4D ODBC PRO, 4D Server allows multiple developers to connect to an ODBC database.

In this manual, 4D and 4D Server are both referred to as 4D except when there is a difference between the behaviour of the two products.

#### Conventions

This manual uses certain conventions to help you understand the material.

• The following explanatory notes are used:

Note: Text emphasized like this provides annotations and shortcuts that will help you use 4D more productively.

Warning: Warnings like this alert you to situations where data might be lost.

- Functions: All 4D ODBC PRO functions are preceded by "ODBC", for exemple: ODBC SQLAllocConnect.
- Table names: In addition, all table names are shown in brackets in the text to help distinguish them from the names of fields, forms, and other items. For instance, the Companies table is written as the [Companies] table.

## Introduction

This manual serves as a reference guide for designers, administrators, and users of integrated 4D ODBC PRO. This manual assumes that you are familiar with the overall architecture and capabilities of your ODBC data source and know 4D's procedural language and the functions available in your ODBC driver.

4D is a powerful data management tool for the Macintosh and Windows. Applications developed with 4D ODBC PRO combine the ease-of-use of a graphical interface with the power of a relational database on a microcomputer.

4D ODBC PRO makes it possible to develop applications that take advantage of the strengths of both 4D and the ODBC data source. Using 4D ODBC PRO, data stored in an SQL database can be accessed from 4D.

#### **ODBC Architecture**

Open Database Connectivity (ODBC) defines a library of functions that allows an application, such as 4D, to access a Database Management System (DBMS) using Structured Query Language (SQL). The ODBC interface offers vendor-neutral access to different database management system.

The ODBC architecture has four components:

- 1. the application
- 2. a driver manager
- 3, the driver
- 4. the data source

The main functionalities provided by any ODBC driver include the following:

- · Connecting to and detaching from a DBMS
- · Performing queries and providing storage areas and data formats for query results
- · Allowing for online transaction processing
- Features external to the ODBC interface (DBMS specific features)
- The driver manager is a dynamically linked library (DLL) that loads drivers, providing a single entry point to ODBC functions for different drivers.

**Note for Macintosh users:** Since the Mac OS built-in ODBC library is not fully operational, it is necessary to install a third-party ODBC framework on this platform. Such a framework can be acquired, for example, from Openlink (http://www.openlinksw.com).

This manual reviews the important aspects of accessing a data source using the low level and control commands in 4D ODBC PRO. These closely resemble native Microsoft ODBC API calls in name, syntax and function. More information regarding the MS ODBC API you can find at the following address:

http://msdn.microsoft.com/en-us/library/ms714562(VS.85).aspx

This manual is not intended to provide a detailed analysis of ODBC operations and functionality.

## **Connection Choices**

The first step when designing any 4D ODBC PRO application is deciding on what database to connect with. ODBC provides many functions that tell what databases are available, describe what type of databases they are, and establish a connection with them.

An application can be designed with a specific target database in mind. For example, an accounting department might have records stored in an ORACLE database. When designing a purchase order system, they know ORACLE drivers are needed. They also know what types of database this is and what attributes are needed to connect to this database. When an application is designed for a target data source, it is possible to take advantage of specific features offered by the DBMS and driver.

Alternatively, an application might need to be designed to work with any database. It will not know beforehand what driver will be used nor which database to connect with. In this case, developers must use caution to only use those features common to all ODBC data sources.

4D ODBC PRO allows developers to develop applications for either of these two scenarios.

## High-level and Low-level ODBC Commands

The high-level ODBC commands integrated into the "External Data Source" theme in 4D allow you to implement simple solutions to make your 4D applications communicate with ODBC data sources. For more information regarding the high-level ODBC commands category, please refer to the 4D Language Reference manual.

If your applications require more advanced ODBC features, you should use the "low-level" and control commands located in the 4D ODBC PRO plug-in and described in this documentation.

The various ODBC functions can be broken down into eleven distinct groups. These following groups of routines allow you to interact with a data source at different stages of communication:

- Connecting to a data source
  Obtaining information about a driver and data source
  Setting and retrieving driver attributes
  Preparing SQL requests
  Submitting requests
  Retrieving results and information about results
  Catalogue functions
  Terminating a statement
  Terminating a connection
  Macro

- Macro
- Error handling

# ODBC\_Catalog functions

- 🛖 Catalog Functions, Introduction
- ODBC\_SQLColumnPrivileges
- ODBC\_SQLColumns
- ODBC\_SQLForeignKeys
- ODBC\_SQLGetTypeInfo
- ODBC\_SQLPrimaryKeys
- ODBC\_SQLProcedureColumns
- ODBC\_SQLProcedures
- ODBC\_SQLSpecialColumns
- ODBC\_SQLStatistics
- ODBC\_SQLTablePrivileges
- ODBC\_SQLTables

# Catalog Functions, Introduction

The catalog commands enable you to retrieve information such as the list of tables stored in a data source's catalog, the list of column names in specified tables and the indexes associated with a table.

Using the catalog commands, you can:

- Get a list of columns and associated privileges for the specified table (ODBC\_SQLColumnPrivileges)
- Obtain a list of column names in specified tables (ODBC SQLColumns)
- Retrieve a list of foreign keys in the specified table or a list of foreign keys in other tables that refer to the primary key in the specified table (ODBC\_SQLForeignKeys)
- Find out the information about data types supported by the data source (ODBC\_SQLGetTypeInfo)
- Retrieve the column names that make up the primary key for a table (ODBC\_SQLPrimaryKeys)
- Get the list of input and output parameters, as well as the columns that make up the result set for the specified procedures (ODBC\_SQLProcedureColumns)
- Obtain the list of procedure names stored in a specific data source (ODBC SQLProcedures)
- Find out information about columns within a specified table. Either the optimal set of columns that uniquely identifies a row in the
  table or the columns that are automatically updated when any value in the row is updated by a transaction.
  (ODBC\_SQLSpecialColumns)
- Get a list of statistics about a single table and the indexes associated with the table (ODBC SQLStatistics)
- Obtain a list of tables and the privileges associated with each table (ODBC\_SQLTablePrivileges)
- Return a list of table, catalog, or schema names, and table types, stored in a specific data source (ODBC SQLTables)

# ODBC\_SQLColumnPrivileges

ODBC\_SQLColumnPrivileges (stmtlD; catalogName; schemaName; tableName; columnName) -> Function result

Parameter	Туре		Description
stmtID	Longint	$\Rightarrow$	Statement ID
catalogName	Text	<b></b>	Catalog name
schemaName	Text	<b></b>	Schema name
tableName	Text	<b>—</b>	Table name
columnName	Text	<b></b>	Column name
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLColumnPrivileges

## **Description**

The ODBC\_SQLColumnPrivileges command returns a list of columns and associated privileges for the specified table. The driver returns the information as a result set on the specified *stmtlD*.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the catalog name.

schemaName is the schema name.

tableName is the table name.

columnName is the string search pattern for column names.

For more information, please see the SQLColumnPrivileges function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716336(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms716336(VS.85).aspx</a>.

### **Function Results**

# ODBC\_SQLColumns

ODBC\_SQLColumns ( stmtlD ; catalogName ; schemaName ; tableName ; columnName ) -> Function result Parameter Type Description Statement ID stmtID Longint catalogName String Catalog name schemaName String String search pattern for schema names tableName String String search pattern for table names String search pattern for column names columnName String

Returns the result of the MS ODBC API function SQLColumns

## **Description**

Function result

The ODBC\_SQLColumns command returns the list of column names in specified tables. The driver returns this information as a result set on the specified stmtlD.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the catalog name.

schemaName is the string search pattern for schema names.

tableName is the string search pattern for table names.

Longint

columnName is the string search pattern for column names.

For more information, please see the SQLColumns function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711683">http://msdn.microsoft.com/en-us/library/ms711683</a>(VS.85).aspx.

#### **Function Results**

# ODBC\_SQLForeignKeys

ODBC\_SQLForeignKeys ( stmtlD ; pkCatalogName ; pkSchemaName ; pkTableName ; fkCatalogName ; fkSchemaName ; fkTableName ) -> Function result

ik rabiename j -> 1 undiomesuit			
Parameter	Type		Description
stmtlD	Longint	$\Rightarrow$	Statement ID
pkCatalogName	String	<b>—</b>	Primary key table catalog name
pkSchemaName	String	<b>—</b>	Primary key table schema name
pkTableName	String	<b>—</b>	Primary key table name
fkCatalogName	String	<b>—</b>	Foreign key table catalog name
fkSchemaName	String	<b>—</b>	Foreign key table schema name
fkTableName	String	<b>—</b>	Foreign key table name
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLForeignKeys

## **Description**

The ODBC\_SQLForeignKeys command returns a list of foreign keys in the specified table or a list of foreign keys in other tables that refer to the primary key in the specified table.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

pkCatalogName is the primary key catalog table name.

pkSchemaName is the primary key schema name.

*pkTableName* is the primary key table name.

fkCatalogName is the foreign key table catalog name.

fkSchemaName is the foreign key table schema name.

fkTableName is the foreign key table name.

For more information, please see the SQLForeignKeys function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709315(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms709315(VS.85).aspx</a>.

### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

# ODBC\_SQLGetTypeInfo

ODBC\_SQLGetTypeInfo ( stmtlD ; dataType ) -> Function result

Function result Longint Square Returns the result of the MS ODBC API function SQLGetTypeInfo

### **Description**

The ODBC\_SQLGetTypeInfo command returns information about data types supported by the data source. The driver returns the information in the form of an SQL result set. The data types are intended for use in Data Definition Language (DDL) statements. stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

dataType is the SQL data type, such as the constant SQL\_ALL\_TYPES, which is equal to 0.

For more information, please see the SQLGetTypeInfo function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714632(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714632(VS.85).aspx</a>.

## **Function Results**

# ODBC\_SQLPrimaryKeys

ODBC SQLPrimaryKeys (stmtlD; catalogName; schemaName; tableName) -> Function result

000	a. j. 10 jo ( 0 a	_ ,	in grammer, contential talline, talline, talline,
Parameter	Type		Description
stmtID	Longint	$\Rightarrow$	Statement ID
catalogName	String	<b>—</b>	Catalog name
schemaName	String	<b>—</b>	String search pattern for schema names
tableName	String	$\Leftrightarrow$	String search pattern for table names
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLPrimaryKeys

## **Description**

The ODBC\_SQLPrimaryKeys command returns column names that make up the primary key for a table. The driver returns the information as a result set. This command does not support returning primary keys from multiple tables in a single call.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the catalog name.

schemaName is the string search pattern for schema names.

tableName is the string search pattern for table names.

For more information, please see the SQLPrimaryKeys function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711005(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711005(VS.85).aspx</a>.

### **Function Results**

# ODBC\_SQLProcedureColumns

ODBC\_SQLProcedureColumns (stmtlD; catalogName; schemaName; procName; columnName) -> Function result

Parameter Type Description

stmtID Longint ⇒ Statement ID
catalogName String ⇒ Procedure catalog name

schemaName String 

String search pattern for procedure schema names

 $\begin{array}{lll} \text{procName} & \text{String} & \Longrightarrow & \text{String search pattern for procedure names} \\ \text{columnName} & \text{String} & \Longrightarrow & \text{String search pattern for column names} \end{array}$ 

Function result Longint Squares Returns the result of the MS ODBC API function SQLProcedureColumns

## **Description**

The ODBC\_SQLProcedureColumns command returns the list of input and output parameters, as well as the columns that make up the result set for the specified procedures. The driver returns the information as a result set on the specified statement.

stmtlD is a valid statement ID returned by ODBC SQLAllocStmt.

catalogName is the procedure catalog name.

schemaName is the string search pattern for procedure schema names.

procName is the string search pattern for procedure names.

columnName is the string search pattern for column names.

For more information, please see the SQLProcedureColumns function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711701(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711701(VS.85).aspx</a>.

#### **Function Results**

# ODBC\_SQLProcedures

 ${\tt ODBC\_SQLProcedures~(~stmtID~;~catalogName~;~schemaName~;~procName~)~->~Function~result}$ 

 Parameter
 Type
 Description

 stmtID
 Longint
 ⇒
 Statement ID

 catalogName
 String
 ⇒
 Procedure catalog name

schemaName String search pattern for procedure schema names

procName String ⇒ String search pattern for procedure names

Function result Longint Seturns the result of the MS ODBC API function SQLProcedures

## **Description**

The ODBC\_SQLProcedures command returns the list of procedure names stored in a specific data source. Procedure is a generic term used to describe an executable object, or a named entity that can be invoked using input and output parameters.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the procedure catalog name.

schemaName is the string search pattern for procedure schema names.

procName is the string search pattern for procedure names.

For more information, please see the SQLProcedures function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms715368(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms715368(VS.85).aspx</a>.

#### **Function Results**

# ODBC\_SQLSpecialColumns

ODBC_SQLSpecialColumns ( stmtlD ; identifierType ; catalogName ; schemaName ; tableName ; scope ; nulllable ) -> Function result			
Parameter	Туре		Description
stmtID	Longint	$\Rightarrow$	Statement ID
identifierType	Longint	$\Rightarrow$	Type of column to return
catalogName	String	$\Rightarrow$	Catalog name for the table
schemaName	String	$\Rightarrow$	Schema name for the table
tableName	String	$\Rightarrow$	Table name
scope	Longint	$\Rightarrow$	Minimum required space of the rowid
nulllable	Longint	$\Rightarrow$	Determines whether to return special columns that can have a NULL value

Returns the result of the MS ODBC API function SQLSpecialColumns

## **Description**

Function result

The ODBC\_SQLSpecialColumns command retrieves the following information about columns within a specified table. Either the optimal set of columns that uniquely identifies a row in the table or the columns that are automatically updated when any value in the row is updated by a transaction.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

identifierType is the type of column to return.

catalogName is the catalog name for the table.

Longint

schemaName is the schema name for the table.

tableName is the table name.

scope is the minimum required space of the row and can have one of the following values:

Constant	Description
SQL_SCOPE_CURROW	The rowid is guaranteed to be valid only while positioned on that row. A later reselect using rowid may not return a row if the row was updated or deleted by another transaction.
SQL_SCOPE_TRANSACTION	The rowid is guaranteed to be valid for the duration of the current transaction.
SQL_SCOPE_SESSION	The rowid is guaranteed to be valid for the duration of the session (across transaction boundaries).

nullable determines whether to return special columns that can have a NULL value.

For more information, please see the SQLSpecialColumns function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714602(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714602(VS.85).aspx</a>.

### **Function Results**

# ODBC\_SQLStatistics

ODBC\_SQLStatistics (stmtlD; catalogName; schemaName; tableName; unique; reserved) -> Function result **Parameter** Description Type stmtID Longint Statement ID catalogName String Catalog name schemaName String Schema name tableName String Table name Longint Type of index unique reserved Longint Indicates the importance of the CARDINALITY and PAGES columns

Returns the result of the MS ODBC API function SQLStatistics

## **Description**

Function result

The ODBC\_SQLStatistics command retrieves a list of statistics about a single table and the indexes associated with the table. stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the catalog name.

Longint

schemaName is the schema name.

tableName is the table name.

*unique* indicates the type of index and can have one of the following values: SQL\_INDEX\_UNIQUE or SQL\_INDEX\_ALL. *reserved* indicates the importance of the CARDINALITY and PAGES columns.

For more information, please see the SQLStatistics function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711022(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711022(VS.85).aspx</a>.

### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

# ODBC\_SQLTablePrivileges

 ${\tt ODBC\_SQLTablePrivileges}~(~{\tt stmtID}~;~{\tt catalogName}~;~{\tt schemaName}~;~{\tt tableName}~)~{\tt ->}~{\tt Function}~{\tt result}~$ 

 Parameter
 Type
 Description

 stmtID
 Longint
 ⇒ Statement ID

 catalogName
 String
 ⇒ Table catalog name

 schemaName
 String
 ⇒ String search pattern for schema names

tableName String 

String search pattern for table names

Function result Longint 

String search pattern for table names

Returns the result of the MS ODBC API function SQLTablePrivileges

# **Description**

The ODBC\_SQLTablePrivileges command returns a list of tables and the privileges associated with each table.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the table catalog name.

schemaName is the string search pattern for schema names.

tableName is the string search pattern for table names.

For more information, please see the SQLTablePrivileges function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713565(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms713565(VS.85).aspx.</a>

### **Function Results**

# ODBC\_SQLTables

ODBC\_SQLTables ( stmtlD ; catalogName ; schemaName ; tableName ; tableType ) -> Function result

Parameter Type Description

stmtlD Longint Statement ID

catalogName String ⇒ Catalog name
schemaName String ⇒ String search pattern for schema names
tableName String ⇒ String search pattern for table names
tableType String ⇒ List of table types to match

Function result Longint Seturns the result of the MS ODBC API function SQLTables

## **Description**

The ODBC\_SQLTables command returns the list of table, catalog, or schema names, and table types, stored in a specific data source.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

catalogName is the catalog name.

schemaName is the string search pattern for schema names.

tableName is the string search pattern for table names.

tableType is the list of table types to match.

For more information, please see the SQLTables function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711831(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711831(VS.85).aspx</a>.

#### **Function Results**

# ODBC\_Connection

- name Connecting to a Data Source
- ODBC\_SQLAllocConnect
- ODBC\_SQLAllocStmt
  ODBC\_SQLBrowseConnect
  ODBC\_SQLConnect

# Connecting to a Data Source

The commands in this chapter enable you to connect to an ODBC data source, by allowing you to do the following:

- Allocate a connection handle (ODBC\_SQLAllocConnect)
- Allocate a statement handle to a valid connection (ODBC\_SQLA/locStmt)
- Establish a connection to a specific driver (*ODBC\_SQLConnect*) or by passing a browse request connection string (*ODBC\_SQLBrowseConnect*)

# ODBC\_SQLAllocConnect

ODBC\_SQLAllocConnect ( connectionID ) -> Function result

Function result Longint Seturns the result of the MS ODBC API function SQLAllocHandle

## **Description**

The ODBC\_SQLAllocConnect command allocates a connection handle to the connectionID parameter, which is a Longint variable that you pass to it. After calling this command, you can establish a connection to a specific data source by calling the ODBC\_SQLConnect command.

For more information, please see the SQLAllocHandle function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714852(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714852(VS.85).aspx</a>.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_INVALID\_HANDLE, or SQL\_ERROR.

## **Example**

See the example for the ODBC\_SQLConnect command.

# ODBC\_SQLAllocStmt

ODBC\_SQLAllocStmt (connectionID; stmtID) -> Function result

Function result Longint Seturns the result of the MS ODBC API function SQLAllocHandle

## **Description**

The ODBC\_SQLAllocStmt function allocates a statement handle to connectionID.

connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

stmtlD is the statement ID returned if the connection is valid. It can then be passed to all other commands that require a stmtlD, like ODBC\_SQLSetStmtAttr and ODBC\_SQLExecute.

For more information, please see the ODBC\_SQLAllocStmt function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712649(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms712649(VS.85).aspx</a>.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_INVALID\_HANDLE, or SQL\_ERROR.

#### **Example**

The following method connects you to a data source and then creates a statement handle ID:

\$result:=ODBC\_SQLAllocConnect(\$connectionID)
\$result:=ODBC\_SQLConnect(\$connectionID;"access";"Administrator";"admin1")
\$result:=ODBC\_SQLAllocStmt(\$connectionID;\$statementID)

# ODBC\_SQLBrowseConnect

ODBC\_SQLBrowseConnect (connectionID; inConnectionStr; outConnectionStr) -> Function result

 Parameter
 Type
 Description

 connectionID
 Longint
 ⇒
 Connection ID

 inConnectionStr
 Text
 ⇒
 Browse request connection string

 outConnectionStr
 Text
 ⇒
 Browse result connection string

 Function result
 Longint
 ⇒
 Returns the result of the MS ODBC API function SQLBrowseConnect

## **Description**

The ODBC\_SQLBrowseConnect command supports an iterative method of discovering and enumerating the attribute values required to connect to a data source. Each call to this command returns successive levels of attributes and attribute values. When all levels have been enumerated, a connection to the data source is completed and a complete connection string is returned.

connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect.

inConnectionStr is the browse request connection string.

outConnectionStr is the browse result connection string.

For more information, please see the SQLBrowseConnect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714565(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714565(VS.85).aspx</a>.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NEED\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

# ODBC\_SQLConnect

ODBC_SQLConnect ( connectionID ; serverName ; userName ; password ) -> Function result			
Parameter	Туре		Description
connectionID	Longint	$\Rightarrow$	Connection ID
serverName	String	$\Rightarrow$	Data source name
userName	String	$\Rightarrow$	User identifier
password	String	$\Rightarrow$	User password
Function result	Longint	<b>ə</b>	Returns the result of the MS ODBC API function SQLConnect

## **Description**

The ODBC\_SQLConnect function establishes a connection to a specific driver by passing it the *serverName*, *userName*, and *password*. It internally uses the MS ODBC API function SQLConnect.

connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect.

serverName is the name of the data source name.

userName is the user name or login name defined when setting up ODBC authorization.

password is the user password.

For more information, please see the SQLConnect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711810(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms711810(VS.85).aspx.</a>

### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

The following method connects you to a data source whose name, username, and password are passed to the *ODBC\_SQLConnect* command:

```
$result:=ODBC_SQLAllocConnect($connectionID)
$result:=ODBC_SQLConnect($connectionID;"access";"Administrator";"admin1")
If($result=SQL_SUCCESS) `Connection was successful
   `... continue by calling other commands that require a valid $connectionID
End if
```

# ODBC\_Driver attributes

- Setting and Retrieving Driver Attributes
- ODBC\_SQLGetConnectAttr
- ODBC\_SQLGetEnvAttr
- ODBC\_SQLGetStmtAttr
- ODBC\_SQLSetConnectAttr
- ODBC\_SQLSetEnvAttr
- ODBC\_SQLSetStmtAttr

# Setting and Retrieving Driver Attributes

The commands in this chapter enable you to set and retrieve connection, environment, and driver attributes. With them, you can do the following:

- Retrieve and set the current setting of a connection attribute (ODBC\_SQLGetConnectAttr and ODBC\_SQLSetConnectAttr)
- Retrieve and set the current setting of an environment attribute (ODBC\_SQLGetEnvAttr and ODBC\_SQLSetEnvAttr)
- Retrieve and set the current setting of a statement attribute (ODBC\_SQLGetStmtAttr and ODBC\_SQLSetStmtAttr).

# ODBC\_SQLGetConnectAttr

ODBC_SQLGetConnectAttr ( connectionID ; attribute ; valuePtr ) -> Function result			
Parameter	Туре		Description
connectionID	Longint	$\Rightarrow$	Connection ID
attribute	Longint	$\Rightarrow$	Attribute to retrieve
valuePtr	Pointer	$\Rightarrow$	Pointer to the current value of the attribute
Function result	Longint	5	Returns the result of the MS ODBC API function SQLGetConnectAttr

### **Description**

The ODBC\_SQLGetConnectAttr command returns the current setting of a connection attribute passed in attribute. This command can be used in conjunction with ODBC\_SetConnectAttr.

connectionID is a valid connection ID returned by either ODBC\_SQLAllocConnect before or ODBC\_SQLConnect after having established a connection to a data source depending on attribute.

attribute is the connection attribute to retrieve and can be one of the following values:

Constant	Description
SQL_ATTR_ACCESS_MODE	Read-only or read-write
SQL_ATTR_ASYNC_ENABLE	Defines if a function can be executed asynchronously
SQL_ATTR_AUTOCOMMIT	Autocommit or manual-commit mode
SQL_ATTR_CONNECTION_TIMEOUT	Number of seconds to wait for a request to complete
SQL_ATTR_CURRENT_CATALOG	Name of the catalog to be used by the data source
SQL_ATTR_LOGIN_TIMEOUT	Number of seconds to wait for a login request
SQL_ATTR_METADATA_ID	Determines how the string arguments of catalog functions are treated
SQL_ATTR_ODBC_CURSORS	Specifies how the Driver Manager uses the ODBC cursor
SQL_ATTR_PACKET_SIZE	Network packet size in bytes
SQL_ATTR_QUIET_MODE	Does not display any dialog boxes, except ODBC_SQLDriverConnect
SQL_ATTR_TRACE	Tracing on or off
SQL_ATTR_TRACEFILE	Name of the trace file
SQL_ATTR_TRANSLATE_LIB	Name of a library containing to perform tasks, such as character set translation
SQL_ATTR_TRANSLATE_OPTION	A value passed to the trnaslation DLL
SQL_ATTR_TXN_ISOLATION	Set the transaction isolation level for connection

*valuePtr* is a pointer to the current value of the attribute defined in the *attribute* parameter. The variable *valuePtr* points to must be a String variable.

For more information, please see the SQLGetConnectAttr function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710297">http://msdn.microsoft.com/en-us/library/ms710297</a>(VS.85).aspx.

### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

The following method sets a connection attribute and then retrieves it:

```
C_STRING(255;vCatalogName;vNewCatalogName)
vCatalogName:="MyCatalogName"
$result:=ODBC_SQLSetConnectAttr($connectionID;SQL_ATTR_CURRENT_CATALOG;->vCatalogName)
$result:=ODBC_SQLGetConnectAttr($connectionID;SQL_ATTR_CURRENT_CATALOG;->vNewCatalogName)
```

# ODBC\_SQLGetEnvAttr

ODBC\_SQLGetEnvAttr (attribute; value) -> Function result

 Parameter
 Type
 Description

 attribute
 Longint
 ⇒
 Attribute to retrieve

value Longint 

Current value of the attribute

Function result Longint Seturns the result of the MS ODBC API function SQLGetEnvAttr

## **Description**

The ODBC\_SQLGetEnvAttr command returns the current setting of an environment attribute.

attribute is the environment attribute to retrieve and can be one of the following values:

Constant	Description
SQL_ATTR_CONNECTION_POOLING	Enables or disables connection pooling at the environment level
SQL_ATTR_CP_MATCH	Determines how a connection is chosen from a connection pool
SQL_ATTR_ODBC_VERSION	Determines whether certain functionality exhibits ODBC 2.x behavior or ODBC 3.x behavior
SQL_ATTR_OUTPUT_NTS	Determines how the driver returns string data

value is the current value of attribute.

For more information, please see the SQLGetEnvAttr function in the MS ODBC API Reference to <a href="http://msdn.microsoft.com/en-us/library/ms709276(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms709276(VS.85).aspx</a>.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### **Example**

The following method sets a environment attribute and then retrieves it:

```
$result:=ODBC_SQLSetEnvAttr(SQL_ATTR_ODBC_VERSION;3)
$result:=ODBC_SQLGetEnvAttr(SQL_ATTR_ODBC_VERSION;vEnvAttribute)
```

# ODBC\_SQLGetStmtAttr

ODBC\_SQLGetStmtAttr ( stmtID ; attribute ; valuePtr ) -> Function result Description Parameter Туре Longint stmtID Statement ID attribute Longint Attribute to retrieve valuePtr Pointer Pointer to the current value of the attribute Function result Longint Returns the result of the MS ODBC API function SQLGetStmtAttr

## **Description**

The ODBC\_SQLGetStmtAttr command returns the current setting of a statement attribute. stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

attribute is the statement attribute to retrieve and can be one of the following values:

Constant	Description
SQL_ATTR_APP_PARAM_DESC SQL_ATTR_APP_ROW_DESC	
	Specifies whether a function called with the specified statement is executed
SQL_ATTR_ASYNC_ENABLE	asynchronously
SQL_ATTR_CONCURRENCY	Specifies the cursor concurrency
SQL_ATTR_CURSOR_SCROLLABLE	Scrollable cursors are either required or not required for the specified statement
SQL_ATTR_CURSOR_SENSITIVITY	Specifies whether cursors for the specified statement handle make visible the changes made to a result set by another cursor
SQL_ATTR_CURSOR_TYPE	Specifies cursor type, like scrolls forward, static, saves and uses the keys for the number of specified rows specified or only those in the rowset
SQL_ATTR_ENABLE_AUTO_IPD	SQL_TRUE = Turns on automatic population of the IPD after a call to ODBC_SQLPrepare. SQL_FALSE = Turns off automatic population of the IPD after a call to ODBC_SQLPrepare.
SQL_ATTR_FETCH_BOOKMARK_PTR	Bookmark value
SQL_ATTR_IMP_PARAM_DESC	The value of this attribute is the descriptor allocated when the statement was initially allocated.
SQL_ATTR_IMP_ROW_DESC	The value of this attribute is the descriptor allocated when the statement was initially allocated.
SQL_ATTR_KEYSET_SIZE	Number of rows in the keyset for a keyset-driven cursor
SQL_ATTR_MAX_LENGTH	Maximum amount of data that the driver returns from a character or binary column.
SQL_ATTR_MAX_ROWS	Maximum number of rows to return to the application for a SELECT statement.
SQL_ATTR_METADATA_ID	Determines how the string arguments of catalog functions are treated.
SQL_ATTR_NOSCAN	Indicates whether the driver should scan SQL strings for escape sequences.
SQL_ATTR_PARAM_BIND_OFFSET_PTR	Bind offset.
SQL_ATTR_PARAM_BIND_TYPE	Indicates the binding orientation to be used for dynamic parameters.
SQL_ATTR_PARAM_OPERATION_PTR	Indicates if a parameter is to be ignored during execution of an SQL statement.
SQL_ATTR_PARAM_STATUS_PTR	Status information for each row of parameter values.
SQL_ATTR_PARAMS_PROCESSED_PTR	Number of sets of parameters that have been processed, including error sets.
SQL_ATTR_PARAMSET_SIZE	Specifies the number of values for each parameter.
SQL_ATTR_QUERY_TIMEOUT	Number of seconds to wait for an SQL statement to execute.  Either retrieve or do not retrieve data after it positions the cursor to the specified
SQL_ATTR_RETRIEVE_DATA	location.
SQL_ATTR_ROW_ARRAY_SIZE	Number of rows returned by each call to ODBC_SQLFetch or ODBC_SQLFetchScroll
SQL_ATTR_ROW_BIND_OFFSET_PTR	An offset to change binding of column data.
SQL_ATTR_ROW_BIND_TYPE	The binding orientation to be used when ODBC_SQLFetch or ODBC_SQLFetchScroll is called on the specified statement.
SQL_ATTR_ROW_NUMBER	Number of the current row in the entire result set.
SQL_ATTR_ROW_OPERATION_PTR	Values used to ignore a row during a bulk operation using ODBC_SQLSetPos.
SQL_ATTR_ROW_STATUS_PTR	Row status values after a call to ODBC_SQLFetch or ODBC_SQLFetchScroll.
SQL_ATTR_ROWS_FETCHED_PTR	Number of rows fetched after a call to ODBC_SQLFetch or ODBC_SQLFetchScroll.
SQL_ATTR_SIMULATE_CURSOR	Specifies whether drivers that simulate positioned update and delete statements guarantee that such statements affect only one single row.
SQL_ATTR_USE_BOOKMARKS	Specifies whether an application will use bookmarks with a cursor.
volvo Divia a maintanta a vaniable that will assets	in the autrent value of attribute

valuePtr is a pointer to a variable that will contain the current value of attribute.

For more information, please see the SQLGetStmtAttr function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms715438(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms715438(VS.85).aspx.</a>

## **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

## **Example**

The following method sets a statement attribute and then retrieves it:

```
vAttributeVal:=SQL_CURSOR_KEYSET_DRIVEN
$result:=ODBC_SQLSetStmtAttr($newStmt; SQL_ATTR_CURSOR_TYPE; ->vAttributeVal)
$result:=ODBC_SQLGetStmtAttr($newStmt; SQL_ATTR_CURSOR_TYPE; ->vNewAttributeValue)
```

# ODBC\_SQLSetConnectAttr

ODBC\_SQLSetConnectAttr ( connectionID ; attribute ; valuePtr ) -> Function result

 Parameter
 Type
 Description

 connectionID
 Longint
 ⇒
 Connection ID

 attribute
 Longint
 ⇒
 Attribute to set

valuePtr → Pointer → Pointer to the value to set the attribute

Function result Longint Square Returns the result of the MS ODBC API function SQLSetConnectAttr

### **Description**

The ODBC\_SQLSetConnectAttr command sets the attributes that govern aspects of connections.

connectionID is a valid connection ID returned by either ODBC\_SQLAllocConnect before or ODBC\_SQLConnect after having established a connection to a data source depending on attribute.

attribute is a connection attribute to set and can be one of the following values:

Constant	Description
SQL_ATTR_ACCESS_MODE*	Read-only or read-write
SQL_ATTR_ASYNC_ENABLE	Defines if a function can be executed asynchronously
SQL_ATTR_AUTOCOMMIT*	Autocommit or manual-commit mode
SQL_ATTR_CONNECTION_TIMEOUT	Number of seconds to wait for a request to complete
SQL_ATTR_CURRENT_CATALOG	Name of the catalog to be used by the data source
SQL_ATTR_LOGIN_TIMEOUT*	Number of seconds to wait for a login request
SQL_ATTR_METADATA_ID	Determines how the string arguments of catalog functions are treated
SQL_ATTR_ODBC_CURSORS*	Specifies how the Driver Manager uses the ODBC cursor
SQL_ATTR_PACKET_SIZE	Network packet size in bytes
SQL_ATTR_QUIET_MODE	Does not display any dialog boxes, except ODBC_SQLDriverConnect
SQL_ATTR_TRACE*	Tracing on or off
SQL_ATTR_TRACEFILE*	Name of the trace file
SQL_ATTR_TRANSLATE_LIB	Name of a library containing to perform tasks, such as character set translation
SQL_ATTR_TRANSLATE_OPTION**	A value passed to the trnaslation DLL
SQL_ATTR_TXN_ISOLATION	Set the transaction isolation level for connection

#### Notes:

valuePtr is a pointer to a variable containing the value at which to set the attribute parameter.

For more information, please see the SQLSetConnectAttr function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713605">http://msdn.microsoft.com/en-us/library/ms713605</a>(VS.85).aspx.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## **Example**

See the example for the ODBC\_SQLGetConnectAttr command.

<sup>\*</sup> These attributes must be set before a connection is established.

<sup>\*\*</sup> This attribute must be set after connecting.

# ODBC\_SQLSetEnvAttr

ODBC\_SQLSetEnvAttr (attribute; value) -> Function result

ParameterTypeDescriptionattributeLongint→Attribute to set

value Longint → Value to set the attribute

Function result Longint Square Returns the result of the MS ODBC API function SQLSetEnvAttr

# **Description**

The ODBC\_SQLSetEnvAttr command sets an attribute that governs the different aspects of environments.

attribute is the environment attribute to set and can be one of the following values:

Constant	Description
SQL_ATTR_CONNECTION_POOLING	Enables or disables connection pooling at the environment level
SQL_ATTR_CP_MATCH	Determines how a connection is chosen from a connection pool
SQL_ATTR_ODBC_VERSION	Determines whether certain functionality exhibits ODBC 2.x behavior or ODBC 3.x behavior
SQL_ATTR_OUTPUT_NTS	Determines how the driver returns string data

value is a Longint value at which to set attribute.

For more information, please see the SQLSetEnvAttr function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709285(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms709285(VS.85).aspx</a>.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## **Example**

See the example for the ODBC\_SQLGetEnvAttr command.

# ODBC\_SQLSetStmtAttr

ODBC\_SQLSetStmtAttr ( stmtID ; attribute ; valuePtr ) -> Function result

Parameter Type Description

stmtID Longint Statement ID

attribute Longint Attribute to set
valuePtr Pointer Pointer Pointer Pointer Pointer to the value to set the attribute

Returns the result of the MS ODBC API function SQLSetStmtAttr

## **Description**

Function result

The ODBC\_SQLSetStmtAttr command sets attribute related to a statement. stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt. attribute is a statement attribute to set and can be one of the following values:

Longint

Constant	Description
SQL ATTR APP PARAM DESC	2000 i piloti
SQL_ATTR_APP_ROW_DESC	
SQL_ATTR_ASYNC_ENABLE	Specifies whether a function called with the specified statement is executed asynchronously
SQL_ATTR_CONCURRENCY	Specifies the cursor concurrency
SQL_ATTR_CURSOR_SCROLLABLE	Scrollable cursors are either required or not required for the specified statement
SQL_ATTR_CURSOR_SENSITIVITY	Specifies whether cursors for the specified statement handle make visible the changes made to a result set by another cursor
SQL_ATTR_CURSOR_TYPE	Specifies cursor type, like scrolls forward, static, saves and uses the keys for the number of specified rows specified or only those in the row set
SQL_ATTR_ENABLE_AUTO_IPD	SQL_TRUE = Turns on automatic population of the IPD after a call to ODBC_SQLPrepare. SQL_FALSE = Turns off automatic population of the IPD after a call to ODBC_SQLPrepare.
SQL_ATTR_FETCH_BOOKMARK_PTR	Bookmark value
SQL_ATTR_IMP_PARAM_DESC	The value of this attribute is the descriptor allocated when the statement was initially allocated.
SQL_ATTR_IMP_ROW_DESC	The value of this attribute is the descriptor allocated when the statement was initially allocated.
SQL_ATTR_KEYSET_SIZE	Number of rows in the keyset for a keyset-driven cursor
SQL_ATTR_MAX_LENGTH	Maximum amount of data that the driver returns from a character or binary column.
SQL_ATTR_MAX_ROWS	Maximum number of rows to return to the application for a SELECT statement.
SQL_ATTR_METADATA_ID	Determines how the string arguments of catalog functions are treated.
SQL_ATTR_NOSCAN	Indicates whether the driver should scan SQL strings for escape sequences.
SQL_ATTR_PARAM_BIND_OFFSET_PTR	Bind offset.
SQL_ATTR_PARAM_BIND_TYPE	Indicates the binding orientation to be used for dynamic parameters.
SQL_ATTR_PARAM_OPERATION_PTR	Indicates if a parameter is to be ignored during execution of an SQL statement.
SQL_ATTR_PARAM_STATUS_PTR	Status information for each row of parameter values.
SQL_ATTR_PARAMS_PROCESSED_PTR	Number of sets of parameters that have been processed, including error sets.
SQL_ATTR_PARAMSET_SIZE	Specifies the number of values for each parameter.
SQL_ATTR_QUERY_TIMEOUT	Number of seconds to wait for an SQL statement to execute.
SQL_ATTR_RETRIEVE_DATA	Either retrieve or do not retrieve data after it positions the cursor to the specified location.
SQL_ATTR_ROW_ARRAY_SIZE	Number of rows returned by each call to ODBC_SQLFetch or ODBC_SQLFetchScroll
SQL_ATTR_ROW_BIND_OFFSET_PTR	An offset to change binding of column data.
SQL_ATTR_ROW_BIND_TYPE	The binding orientation to be used when <b>ODBC_SQLFetch</b> or ODBC_SQLFetchScroll is called on the specified statement.
SQL_ATTR_ROW_NUMBER	Number of the current row in the entire result set.
SQL_ATTR_ROW_OPERATION_PTR	Values used to ignore a row during a bulk operation using ODBC_SQLSetPos.
SQL_ATTR_ROW_STATUS_PTR	Row status values after a call to ODBC_SQLFetchor ODBC_SQLFetchScroll.
SQL_ATTR_ROWS_FETCHED_PTR	Number of rows fetched after a call to ODBC_SQLFetch or ODBC_SQLFetchScroll.
SQL_ATTR_SIMULATE_CURSOR	Specifies whether drivers that simulate positioned update and delete statements guarantee that such statements affect only one single row.
SQL_ATTR_USE_BOOKMARKS	Specifies whether an application will use bookmarks with a cursor.

*valuePtr* is a pointer to a variable containing the value at which to set the *attribute* parameter.

For more information, please see the SQLSetStmtAttr function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712631(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms712631(VS.85).aspx.</a>

## **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

## **Example**

See the example for the ODBC\_SQLBulkOperations command.

# ODBC\_End connection

- 🚁 Terminating a Connection, Introduction
- ODBC\_SQLEndTran
- ODBC\_SQLFreeConnect

# 🚁 Terminating a Connection, Introduction

The commands in this chapter enable you to terminate a connection, so you can:

- Close the connection (ODBC\_SQLDisconnect)
- Request a commit or rollback operation for all active operations on all statements associated with a connection (ODBC\_SQLEndTran)
- Free up resources associated with a connection handle (ODBC\_SQLFreeConnect)

## ODBC\_SQLDisconnect

ODBC\_SQLDisconnect ( connectionID ) -> Function result

 $\begin{array}{lll} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{connectionID} & \textbf{Longint} & \Rightarrow & \textbf{Connection ID} \end{array}$ 

Function result Longint Seturns the result of the MS ODBC API function SQLDisconnect

## **Description**

The ODBC SQLDisconnect command closes the connection specified by connectID.

connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

For more information, please see the SQLDisconnect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713946(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms713946(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## ODBC\_SQLEndTran

 ${\tt ODBC\_SQLEndTran}\ (\ handle{\tt Type}\ ; handle{\tt ID}\ ; completion{\tt Type}\ ) {\tt -> Function}\ result$ 

 Parameter
 Type
 Description

 handleType
 Longint
 ⇒ Type of ID to pass to handleID

 handleID
 Longint
 ⇒ Either the statement ID or the connection ID

 completionType
 Longint
 ⇒ Either SQL\_COMMIT or SQL\_ROLLBACK

 Function result
 Longint
 ⇒ Returns the result of the MS ODBC API function SQLEndTran

#### **Description**

The ODBC\_SQLEndTran command requests a commit or rollback operation for all active operations on all statements associated with a connection. ODBC\_SQLEndTran can also request that a commit or rollback operation be performed for all connections associated with an environment.

If no transactions are active, ODBC\_SQLEndTran returns SQL\_SUCCESS with no effect on any data sources.

handleType defines which type of ID to pass to handleID and can have one of the following two values:

Constant	Description
SQL_HANDLE_STMT	Statement ID
SQL HANDLE DBC	Connection ID

handleID is the connectionID if handleType is equal to SQL\_HANDLE\_DBC. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

Otherwise, handleID is the stmtID, which is a valid statement ID returned by ODBC SQLAllocStmt.

completionType can have one of the following two values:

Constant	Description	
SQL_COMMIT	Commit changes	
SQL_ROLLBACK	Rollback changes	

For more information, please see the SQLEndTran function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716544(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms716544(VS.85).aspx</a>.

#### **Function Results**

SQL SUCCESS, SQL SUCCESS WITH INFO, SQL ERROR, or SQL INVALID HANDLE.

# ODBC\_SQLFreeConnect

ODBC\_SQLFreeConnect (connectionID) -> Function result

Function result Longint SQLFreeConnect Returns the result of the MS ODBC API function SQLFreeConnect

## **Description**

The ODBC\_SQLFreeConnect command frees resources associated with a connection handle. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect.

For more information, please see the SQLFreeConnect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709370(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms709370(VS.85).aspx.</a>

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

# ODBC\_End statement

- 🚁 Terminating a Statement, Introduction
- ODBC\_SQLCloseCursor
- ODBC\_SQLFreeStmt

## Terminating a Statement, Introduction

The commands in this chapter enable you to terminate a statement, by allowing you to do the following:

- Get a list of columns and associated privileges for the specified table (ODBC\_SQLCancel)
- Close a cursor that has been opened on a statement and discards pending results (ODBC\_SQLCloseCursor)
- Stop the processing associated with a specific statement, closes any open cursors associated with the statement, discards pending results, or, optionally, frees all resources associated with the statement handle (ODBC\_SQLFreeStmt)

# ODBC\_SQLCancel

ODBC\_SQLCancel ( stmtlD ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{stmtID} & \textbf{Longint} & \Rightarrow & \textbf{Statement ID} \end{array}$ 

Function result Longint Square Returns the result of the MS ODBC API function SQLCancel

## **Description**

The ODBC\_SQLCancel command cancels the processing on a statement.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

For more information, please see the SQLCancel function in the MS ODBC API Reference at  $\frac{http://msdn.microsoft.com/enus/library/ms714112(VS.85).aspx.}{}$ 

## **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

# ODBC\_SQLCloseCursor

ODBC\_SQLCloseCursor ( stmtlD ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \text{stmtID} & \text{Longint} & \Rightarrow & \text{Statement ID} \end{array}$ 

Function result Longint Square Returns the result of the MS ODBC API function SQLCloseCursor

## **Description**

The ODBC\_SQLCloseCursor command closes a cursor that has been opened on a statement and discards pending results. stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

For more information, please see the SQLCloseCursor function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709301(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms709301(VS.85).aspx</a>.

## **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

# ODBC\_SQLFreeStmt

ODBC\_SQLFreeStmt ( stmtlD ; option ) -> Function result

Function result Longint SQLFreeStmt

## **Description**

The ODBC\_SQLFreeStmt command stops the processing associated with a specific statement, closes any open cursors associated with the statement, discards pending results, or, optionally, frees all resources associated with the statement handle.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

The option parameter can take one of the following values:

Constants	Description
SQL_CLOSE	Closes the cursor associated with StatementHandle (if one was defined) and discards all pending results
SQL_UNBIND	Sets the SQL_DESC_COUNT field of the ARD to 0, releasing all column buffers bound by SQLBindCol for the given stmtlD
SQL_RESET_PARAMS	Sets the SQL_DESC_COUNT field of the APD to 0, releasing all parameter buffers set by SQLBindParameter for the given stmtlD
SQL_DROP	Frees the statement handle

For more information, please see the SQLFreeStmt function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709284(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms709284(VS.85).aspx.</a>

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## **Example**

See the example for the ODBC\_SQLFetch command.

# ODBC\_Error handling

- 🚁 Error Handling, Introduction
- ODBC\_SetErrorHandler

# Error Handling, Introduction

The command in this chapter enables you to install an error method that will handle the errors (ODBC\_SetErrorHandler).

# ODBC\_SetErrorHandler

ODBC\_SetErrorHandler ( errorMethod )

Parameter Type Description

errorMethod String 

Error method to be invoked, or Empty string to stop trapping errors

## **Description**

The ODBC\_SetErrorHandler command installs an error-handling method that will handle the errors for all processes and 4D ODBC PRO will no longer display the alert informing you of invalid connection and/or statement IDs.

The called method will receive 2 parameters in \$1 and \$2:

- \$1 gets the error number,
- \$2 gets the error text.

**Note:** Due to database compilation, \$1 and \$2 must be declared respectively as longint (C\_LONGINT) and text (C\_TEXT) in the error method.

The method installed by this command can use the ODBC\_SQLGetDiagRec routine to get more information on the error.

To uninstall the error handling method, pass an empty string to ODBC\_SetErrorHandler.

# ODBC\_Information

- 🏇 Obtaining Information about a Driver and Data Source
- ODBC\_SQLDataSources
- ODBC\_SQLDriverConnect
- ODBC\_SQLDrivers
- ODBC\_SQLGetFunctions
- ODBC\_SQLGetInfo

# Obtaining Information about a Driver and Data Source

The commands in this chapter enable you to obtain information about a driver and data source, such as:

- Retrieve information about the data source defined (ODBC\_SQLDataSources)
- Obtain a list of driver descriptions and driver attribute keywords (ODBC\_SQLDrivers)
   Find out if a specific ODBC function is supported by the driver (ODBC\_SQLGetFunctions)
- Obtain general information about the driver and data source associated with a connection (ODBC\_SQLGetInfo)

## ODBC\_SQLDataSources

ODBC_SQLDataSources ( direction ; serverName ; description ) -> Function result			
Parameter	Type		Description
direction	Longint	$\Rightarrow$	Which data source the Driver Manager returns information for
serverName	Text	<b>—</b>	Data source name
description	Text	<b>—</b>	Description of the driver associated with the data source
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLDataSources

#### **Description**

The ODBC\_SQLDataSources command returns information about the User and System data sources defined in the Driver Manager.

The direction parameter defines how to fetch the data sources and can be one of the following values:

Constant	Description
SQL_FETCH_NEXT	Fetch the next data source name in the list
SQL_FETCH_FIRST	Fetch from the beginning of the list
SQL_FETCH_FIRST_USER	Fetch the first User data sources
SQL_FETCH_FIRST_SYSTEM	Fetch the first System data sources

serverName is the name of the data source, such as "MS Access Database."

description is the description of the driver associated with the data source, like "Microsoft Access Driver (\*.mdb)."

For more information, please see the SQLDataSources function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711004(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms711004(VS.85).aspx.</a>

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### **Example**

The following method retrieves all the data sources and their descriptions and puts them into two arrays:

```
ARRAY TEXT (arServer;0)

ARRAY TEXT (arDescription;0)

$result:=ODBC_SQLDataSources(SQL_FETCH_FIRST;vServer;vDescription)

If ($result=SQL_SUCCESS) `If it's successful, there might be other data sources

Repeat

APPEND TO ARRAY(arServer;vServer) `add server name to end of the array

APPEND TO ARRAY(arDescription;vDescription) `add description to end of the array

$result:=ODBC_SQLDataSources(SQL_FETCH_NEXT;vServer;vDescription)

Until($result=SQL_NO_DATA) `loop until no data is retrieved by the command

End if
```

# ODBC\_SQLDriverConnect

ODBC\_SQLDriverConnect -> Function result

Parameter Type Description

Function result Longint Square Returns the result of the MS ODBC API function SQLDriverConnect

## **Description**

The ODBC\_SQLDriverConnect command is not yet documented.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE. For more information, please see the SQLDriverConnect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms715433(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms715433(VS.85).aspx</a>.

## ODBC\_SQLDrivers

ODBC\_SQLDrivers ( direction ; driverDescription ; driverAttributes ) -> Function result

Parameter Type Description

direction Longint Direction from which to retrieve the drivers

driverDescription Text Description of the driver

driverAttributes Text List of driver attribute value pairs

Function result Longint Returns the result of the MS ODBC API function SQLDrivers

#### **Description**

The ODBC\_SQLDrivers command lists driver descriptions and driver attribute keywords.

The direction parameter determines which driver in the Driver Manager list to retrieve and can be one of the following values:

Constant	Description
SQL_FETCH_NEXT	Fetch the next driver description in the list
SQL FETCH FIRST	Fetch from the beginning of the driver description list

driverDescription is the description of the driver, such as "SQL Server", "Microsoft Access Driver (\*.mdb)", and "Microsoft ODBC for Oracle".

driverAttributes returns the list of driver attribute pairs, such as "UsageCount", "SQLLevel", "FileUsage", "DirverODBCVer", "ConnectFunctions", "APILevel", "CPTimeout", and "FileExtns" along with their values, such as "UsageCount=2" and each pair is delimited by a **Char**(0).

For more information, please see the SQLDrivers function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712400(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms712400(VS.85).aspx</a>.

#### **Function Results**

SQL SUCCESS, SQL SUCCESS WITH INFO, SQL NO DATA, SQL ERROR, or SQL INVALID HANDLE.

#### **Example**

The following method puts the driver description in one array and the driver's attribute value pairs into two-dimensional arrays:

Here is the code for the ParseDriverAttributePairs method:

```
` Method: ParseDriverAttributePairs
    `$1 : Text : Input text to parse
    `$2 : Pointer : A text array to hold the names
    `$3 : Pointer : A text array to hold the values

C_TEXT($1;$input_t;$valuePair_t)
C_POINTER($2;$3;$names_aptr;$values_aptr)
C_LONGINT($position_i)
$input_t:=$1
$names_aptr:=$2
$values_aptr:=$3
ARRAY TEXT($names_aptr->;0)
ARRAY TEXT($values_aptr->;0)
```

```
Repeat
    $position_i:=Position(Char(0); $input_t)

If($position_i>0)
    $valuePair_t:=Substring($input_t; 1; $position_i)
    $input_t:=Substring($input_t; $position_i+1)
    $position_i:=Position("="; $valuePair_t)
    If($position_i>0)
          APPEND TO ARRAY($names_aptr->; Substring($valuePair_t; 1; $position_i-1))
         APPEND TO ARRAY($values_aptr->; Substring($valuePair_t; $position_i+1))
         End if
    End if
    Until($position_i=0)
```

# ODBC\_SQLGetFunctions

ODBC\_SQLGetFunctions (connectionID; functionIdentifier; infoValuePtr) -> Function result

 Parameter
 Type
 Description

 connectionID
 Longint
 ⇒
 Connection ID

 functionIdentifier
 Longint
 ⇒
 Function identifier

 infoValuePtr
 Pointer
 ⇒
 Indicates if a function is supported or not by the driver

 Function result
 Longint
 ⇒
 Returns the result of the MS ODBC API function SQLGetFunctions

## **Description**

The ODBC\_SQLGetFunctions command allows you to determine which specific ODBC functions a driver supports. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

functionIdentifier is the identifier of the function to test to see if it is supported by the driver and can be one of the values below:

Constant	Value
SQL API SQLALLOCCONNECT	value 1
	-
SQL_API_SQLALLOCENV	2
SQL_API_SQLALLOCHANDLE	1001
SQL_API_SQLALLOCSTMT	3
SQL_API_SQLBINDCOL	4

infoValuePtr is a pointer to a Longint variable that will be equal to either SQL\_TRUE if the specified function is supported by the driver

or SQL\_FALSE if it is not supported.

ODBC\_SQLGetFunctions returns SQL\_SUCCESS if the function executes correctly.

For more information, please see the SQLGetFunctions function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms709291(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms709291(VS.85).aspx.</a>

## **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

# ODBC\_SQLGetInfo

ODBC_SQLGetInfo ( connectionID ; infoType ; infoValuePtr ) -> Function result			
Parameter	Type		Description
connectionID	Longint	$\Rightarrow$	Connection ID
infoType	Longint	$\Rightarrow$	Type of information
infoValuePtr	Pointer	<b>—</b>	Information regarding the driver and data source
Function result	Longint	5	Returns the result of the MS ODBC API function SQLGetInfo

# Description

The ODBC\_SQLGetInfo command returns general information about the driver and data source associated with a connection. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

If the *infoType* defines the type of information regarding a driver and data source and can be one of the following values:

The *infoValuePtr* argument retrieves the information regarding the driver and data source defined by *infoType*. The value returned depends on the type of information passed to *infoType*.

For more information, please see the SQLGetInfo function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711681(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms711681(VS.85).aspx.</a>

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

## **Example**

The following method connects you to a data source and then retrieves information about the driver to find out the level of asynchronous support in the driver:

```
$result:=ODBC_SQLSetEnvAttr(SQL_ATTR_ODBC_VERSION;3)
```

```
$result:=ODBC_SQLAllocConnect($connectionID)
$result:=ODBC_SQLConnect($connectionID;"oracle4d";"Admin";"admin1")
$result:=ODBC_SQLGetInfo($connectionID;10021;->asyncType) `SQL_ASYNC_MODE
```

# ODBC\_Macros

- 🛖 Macros, Introduction
- ODBC\_LenDataAtExec

# Macros, Introduction

The command in this chapter enables you to manage macros (ODBC\_LenDataAtExec).

# ODBC\_LenDataAtExec

ODBC\_LenDataAtExec ( lengthData ) -> Function result

ParameterTypeDescriptionlengthDataLongint→Value to convertFunction resultLongint→Converted value

## **Description**

The ODBC\_LenDataAtExec command is used to pass the the parameter at execution time to ODBC\_SQLPutData.

## **Example**

See the example for the ODBC\_SQLPutData command.

# ODBC\_Prepare requests

- Preparing SQL Requests
- ODBC\_SQLBindParameter
- ODBC\_SQLGetCursorName
- ODBC\_SQLPrepare
- ODBC\_SQLSetCursorName

## Preparing SQL Requests

The commands in this chapter enable you to prepare SQL requests, by allowing you to do the following:

- Bind a parameter in an SQL Statement (ODBC\_SQLBindParameter)
- Retrieve the cursor name associated with a statement (ODBC\_SQLGetCursorName)
- Prepare an SQL string for execution (ODBC\_SQLPrepare)
- Set the cursor name in a specific statement (ODBC\_SQLSetCursorName)

## ODBC\_SQLBindParameter

ODBC\_SQLBindParameter ( stmtlD ; paramNumber ; lOType ; paramType ; columnSize ; decimalDigits ; paramValPtr ; strLenOrIndPtr ) -> Function result Parameter Type Description stmtID Statement ID Longint paramNumber Longint Parameter number, ordered sequentially in increasing parameter order, starting at 1 **IOType** Longint Type of the parameter Input or Output  $\Rightarrow$ SQL data type of the parameter paramType Longint columnSize ⇒ The size of the column or expression of the corresponding parameter defined Longint decimalDigits ⇒ The decimal digits of the column or expression of the corresponding parameter defined Longint A pointer to a 4D variable or field paramValPtr Pointer strLenOrIndPtr Pointer A pointer to the parameter's length if it's a Text value Returns the result of the MS ODBC API function SQLBindParameter Function result Longint 5

### **Description**

The ODBC\_SQLBindParameter command binds a parameter and its value in an SQL Statement.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

paramNumber is the parameter number in the statement defined by ODBC\_SQLPrepare, ordered sequentially in increasing parameter order, starting at 1.

IOType defines whether this bind parameter is for input, output, or for input and output and can have one of the following values:

Constant	Value
SQL_PARAM_INPUT	1
SQL_PARAM_INPUT_OUTPUT	2
SQL_PARAM_OUTPUT	4

paramType is the SQL data type of the parameter and can be equal to one of the following values:

Constant **SQL Data Type** SQL CHAR CHAR SQL VARCHAR **VARCHAR** SQL LONGVARCHAR LONG VARCHAR SQL DECIMAL **DECIMAL** SQL NUMERIC NUMERIC SQL\_SMALLINT **SMALLINT** SQL INTEGER **INTEGER** SQL REAL **REAL** SQL\_FLOAT FLOAT SQL DOUBLE **DOUBLE PRECISION** SQL BIT **BIT** SQL\_TINYINT **TINYINT** SQL BIGINT **BIGINT** SQL BINARY **BINARY** SQL VARBINARY **VARBINARY** LONG VARBINARY SQL\_LONGVARBINARY SQL\_TYPE\_DATE Date SQL TYPE TIME Time SQL TYPE TIMESTAMP **TIMESTAMP** SQL INTERVAL MONTH INTERVAL MONTH SQL INTERVAL YEAR INTERVAL YEAR SQL\_INTERVAL\_YEAR\_TO\_MONTH INTERVAL YEAR TO MONTH SQL\_INTERVAL\_DAY INTERVAL DAY SQL INTERVAL HOUR INTERVAL HOUR SQL\_INTERVAL\_MINUTE INTERVAL MINUTE SQL INTERVAL SECOND INTERVAL SECOND SQL INTERVAL DAY TO HOUR INTERVAL DAY TO HOUR SQL\_INTERVAL\_DAY\_TO\_MINUTE INTERVAL DAY TO MINUTE SQL INTERVAL DAY TO SECOND INTERVAL DAY TO SECOND SQL INTERVAL HOUR TO MINUTE INTERVAL HOUR TO MINUTE SQL INTERVAL HOUR TO SECOND INTERVAL HOUR TO SECOND SQL\_INTERVAL\_MINUTE\_TO\_SECOND INTERVAL MINUTE TO SECOND

columnSize defines the size of the column or expression of the parameter defined.

decimalDigits defines the decimal digits of the column or expression of the parameter defined.

paramValPtr is a pointer to a 4D variable or field.

strLenOrIndPtr is a pointer to a variable that defines the parameter's length if paramType is of type Text, Picture, or BLOB. Use the ODBC\_LenDataAtExec command to convert the actual length so that it can be processed by the MS ODBC API.

For more information, please see the SQLBindParameter function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710963">http://msdn.microsoft.com/en-us/library/ms710963</a>(VS.85).aspx.

## **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

See the example for the ODBC\_SQLExecute command.

## ODBC\_SQLGetCursorName

ODBC\_SQLGetCursorName ( stmtlD ; cursorName ) -> Function result

 $\begin{array}{llll} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \text{stmtID} & \text{Longint} & \Rightarrow & \text{Statement ID} \\ \text{cursorName} & \text{String} & \leftarrow & \text{Cursor name} \\ \end{array}$ 

Function result Longint Seturns the result of the MS ODBC API function SQLGetCursorName

#### **Description**

The ODBC\_SQLGetCursorName command returns the cursor name associated with a statement. Cursor names are used only in positioned update and delete statements.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

cursorName is the name of the cursor that was previously set by ODBC SQLSetCursorName.

For more information, please see the SQLGetCursorName function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716209(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms716209(VS.85).aspx.</a>

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## **Example**

The following method sets a cursor name and then retrieves it. After some processing, the cursor is used to update data in the table:

```
$result:=ODBC_SQLSetCursorName($statementID;"C1")
$result:=ODBC_SQLExecDirect($statementID;"SELECT ID, Name FROM Employee")
$result:=ODBC_SQLGetCursorName($statementID;vNewCursorName)
.
. `more processing...
.
$result:=ODBC_SQLExecDirect($newStmt1;"UPDATE Employee SET Name='Test' WHERE 'CURRENT OF C1'")
```

# ODBC\_SQLPrepare

ODBC\_SQLPrepare ( stmtlD ; statementText ) -> Function result

Function result Longint Square Returns the result of the MS ODBC API function SQLPrepare

## **Description**

The ODBC\_SQLPrepare command prepares a SQL string for execution passed in *statementText*. *stmtlD* is a valid statement ID returned by ODBC\_SQLAllocStmt.

statementText is the SQL text string to be executed later with ODBC SQLExecute.

For more information, please see the SQLPrepare function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710926(VS.85).aspx.">http://msdn.microsoft.com/en-us/library/ms710926(VS.85).aspx.</a>

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

## **Example**

See the example for the ODBC SQLFetch command.

## ODBC\_SQLSetCursorName

ODBC\_SQLSetCursorName ( stmtlD ; cursorName ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \text{stmtID} & \text{Longint} & \Rightarrow & \text{Statement ID} \end{array}$ 

cursorName String → Name of the cursor to set

Function result Longint Square Returns the result of the MS ODBC API function SQLSetCursorName

#### **Description**

The ODBC\_SQLSetCursorName command associates a cursor name with an active statement. If this command is not called, the driver generates cursor names needed for SQL statement processing.

For efficient processing, the cursor name should not include any leading or trailing spaces, and if the cursor name includes a delimited identifier, the delimiter should be positioned as the first character in the cursor name. Cursor names are used only in positioned update and delete statements and should not exceed 18 characters in length.

If the SQL statement is a SELECT statement and if you set a cursor name with a statement, then the driver uses the specified cursor. Otherwise, the driver generates a cursor name.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

cursorName is the name of the cursor that was previously set by ODBC\_SQLSetCursorName.

For more information, please see the SQLSetCursorName function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711707">http://msdn.microsoft.com/en-us/library/ms711707</a>(VS.85).aspx.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

See the example for the ODBC\_SQLGetCursorName command.

# ODBC\_Results

- \*\* Retrieving Results and Information, Introduction
- ODBC\_SQLBindCol
- ODBC\_SQLBulkOperations
- ODBC\_SQLColAttribute
- ODBC\_SQLDescribeCol
- ODBC\_SQLFetch
- ODBC\_SQLFetchScroll
- ODBC\_SQLGetData
- ODBC\_SQLGetDescField

- ODBC\_SQLRowCount
- ODBC\_SQLSetDescField
- ODBC\_SQLSetDescRec
- ODBC\_SQLSetPos

## Retrieving Results and Information, Introduction

The commands in this chapter enable you to retrieve results and information about the results, by allowing you to do the following:

- Bind application data buffers to columns in the result set (ODBC SQLBindCol)
- Perform bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark (ODBC SQLBulkOperations)
- Get the descriptor information for a column in a result set (ODBC SQLColAttribute)
- Retrieve the result descriptor, such as column name, type, column size, decimal digits, and nullability, for one column in the result set (ODBC\_SQLDescribeCol)
- Fetch the next rowset of data from the result set and returns data for all bound columns (ODBC\_SQLFetch)
- Fetch the specified rowset of data from the result set and returns data for all bound columns (ODBC SQLFetchScroll)
- Get data for a single column in the result set (ODBC\_SQLGetData)
- Get the current setting or value of a single field of a descriptor record (ODBC\_SQLGetDescField)
- Get the current settings or values of multiple fields of a descriptor record (ODBC\_SQLGetDescRec)
- Get the current value of a field of a record of the diagnostic data structure (associated with a specified handle) that contains
  error, warning, and status information (ODBC SQLGetDiagField)
- Get the current values of multiple fields of a diagnostic record that contains error, warning, and status information (ODBC\_SQLGetDiagRec)
- Determine whether more results are available on a statement containing SELECT, UPDATE, INSERT or DELETE statements
  and, if so, initializes processing for those results (ODBC\_SQLGetMoreResults)
- Find out the number of columns in a result set (ODBC\_SQLNumResultCols)
- Get the number of rows affected by an UPDATE, INSERT, or DELETE statement (ODBC\_SQLRowCount)
- Set the current setting or value of a single field of a descriptor record (ODBC SQLSetDescField)
- Set the current settings or values of multiple fields of a descriptor record (ODBC\_SQLSetDescRec)
- Set the cursor position in a rowset and allows an application to refresh data in the rowset or to update or delete data in the result set (ODBC\_SQLSetPos)

### ODBC\_SQLBindCol

ODBC SQLBindCol ( stmtlD ; colNb ; targetValPtr ; strLenOrInd ) -> Function result

_ `	Ť		
Parameter	Туре		Description
stmtlD	Longint	$\Rightarrow$	Statement ID
colNb	Longint	$\Rightarrow$	Number of the result set column to bind
targetValPtr	Pointer	←	Pointer to the target to bind the column
strLenOrInd	Pointer	<b>(</b>	Pointer to the length/indicator buffer to bind to the column
Function result	Longint	5	Returns the result of the MS ODBC API function SQLBindCol
	Parameter stmtID coINb targetValPtr strLenOrInd Function result	stmtID Longint colNb Longint targetValPtr Pointer strLenOrInd Pointer	stmtID Longint  colNb Longint  ⇒ targetValPtr Pointer strLenOrInd Pointer  ⇔

### **Description**

The ODBC\_SQLBindCol command binds application data buffers to columns in the result set.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

coINB is the number of the result set column to bind. Columns are numberes in increasing column order starting at 0, where the column 0 is the bookmark column.

targetValuePtr is a pointer to the variable, 4D field or array to bind to the column.

strLenOrInd is an optional parameter that is a pointer to the length of the parameter, which is a Longint, if paramType is of type Text, Picture, or BLOB. Use the ODBC\_LenDataAtExec command to convert the actual length so that it can be processed by the MS ODBC API.

For more information, please see the SQLBindCol function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711010(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711010(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### **Example**

See the examples for the ODBC\_SQLFetch and ODBC\_SQLBulkOperations.

### ODBC\_SQLBulkOperations

ODBC_SQLBulkOperations ( stmtlD ; operation ) -> Function result			
Parameter	Type		Description
stmtID	Longint	$\Rightarrow$	Statement ID
operation	Longint	$\Rightarrow$	Operation to perform
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLBulkOperations

#### **Description**

The ODBC\_SQLBulkOperations command performs bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

The operation to perform are the following:

Constant	Value
SQL_ADD	4
SQL_UPDATE_BY_BOOKMARK	5
SQL_DELETE_BY_BOOKMARK	6
SQL_FETCH_BY_BOOKMARK	7

For more information, please see the SQLBulkOperations function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712471(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms712471(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NEED\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.}$ 

#### **Example**

The following method adds three rows from data in two arrays (arlD and arEmployeeName) into the Employee table:

```
vattrVal:=SQL CONCUR ROWVER
$result:=ODBC SQLSetStmtAttr($statementID; SQL ATTR CONCURRENCY; ->vattrVal)
vattrVal:=SQL CURSOR KEYSET DRIVEN
$result:=ODBC SQLSetStmtAttr($statementID;SQL ATTR CURSOR TYPE;->vattrVal)
vattrVal:=3    ` Size of the arrays that contain our values below
$result:=ODBC SQLSetStmtAttr($statementID; SQL ATTR ROW ARRAY SIZE;->vattrVal)
$result:=ODBC SQLSetStmtAttr($statementID; SQL ATTR ROW STATUS PTR;->arStatus; vIndic)
vattrVal:=SQL UB VARIABLE
$result:=ODBC SQLSetStmtAttr($statementID; SQL USE BOOKMARKS; ->vattrVal)
$result:=ODBC SQLPrepare($statementID;"SELECT * FROM Employee")    Define which table
$result:=ODBC SQLExecute($statementID)
$result:=ODBC SQLBindCol($statementID;1;->arID)   `Bind the columns to arrays

### ODBC\_SQLColAttribute

Longint

ODBC\_SQLColAttribute ( stmtlD ; colNb ; fieldIdentifier ; characterAttrPtr ) -> Function result Parameter Type Description stmtID Statement ID Longint ⇒ colNb Longint ⇒ Number of the record from which the field value is to be retrieved fieldIdentifier Longint Field identifier in row colNb that is to be returned characterAttrPtr Value in the fieldID field of the coINb row if the field is a character string. Otherwise, the field is unused Pointer Function result Returns the result of the MS ODBC API function SQLColAttribute

### **Description**

The ODBC\_SQLColAttribute command returns descriptor information for a column in a result set.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

colNb is the number of the column from which the field value is to be retrieved.

field/Identifier defines which field in row coINb to be returned, which can be one of the following values:

Constant	Description
SQL_DESC_AUTO_UNIQUE_VALUE	SQL_TRUE if the column is an autoincrementing column. SQL_FALSE if the column is not an auto-incrementing column or is not numeric.
SQL_DESC_BASE_COLUMN_NAME	The base column name for the result set column.
SQL_DESC_BASE_TABLE_NAME	Name of the base table that contains the column.
SQL_DESC_CASE_SENSITIVE	SQL_TRUE if the column is treated as case-sensitive for collations and comparisons.  SQL_FALSE if the column is not treated as case-sensitive for collations and comparisons or is noncharacter
SQL_DESC_CATALOG_NAME	Catalog of the table that contains the column.
SQL_DESC_CONCISE_TYPE	Concise data type.
SQL_DESC_COUNT	Number of columns available in the result set.
SQL_DESC_DISPLAY_SIZE	Maximum number of characters required to display data from the column.
SQL_DESC_DISPLAY_SIZE	Maximum number of characters required to display data from the column.
SQL_DESC_FIXED_PREC_SCALE	SQL_TRUE if the column has a fixed precision and nonzero scale that are data source—specific. SQL_FALSE if the column does not have a fixed precision and nonzero scale that are data source-specific.
SQL_DESC_LABEL	Column label or title.
SQL_DESC_LENGTH	A numeric value that is either the maximum or actual character length of a character string or binary data type.
SQL_DESC_LITERAL_PREFIX	Character or characters that the driver recognizes as a prefix for a literal of this data type.
SQL_DESC_LITERAL_SUFFIX	Character or characters that the driver recognizes as a suffix for a literal of this data type.
SQL_DESC_LOCAL_TYPE_NAME	Any localized (native language) name for the data type that may be different from the regular name of the data type.
SQL_DESC_NAME	Column alias, if it applies.
SQL_DESC_NULLABLE	SQL_ NULLABLE if the column can have NULL values; SQL_NO_NULLS if the column does not have NULL values; or SQL_NULLABLE_UNKNOWN if it is not known whether the column accepts NULL values.
SQL_DESC_NUM_PREX_RADIX	Returns 2 if the field is anapproximate numeric data type. If the data type is an exact numeric type, it returns 10 because the SQL_DESC_PRECISION field contains the number of decimal digits. This field is set to 0 for all non-numeric data types.
SQL_DESC_OCTET_LENGTH	Length, in bytes, of a character string or binary data type.
SQL_DESC_PRECISION	A numeric value that for a numeric data type denotes the applicable precision.
SQL_DESC_SCALE	A numeric value that is the applicable scale for a numeric data type.
SQL_DESC_SCHEMA_NAME	The schema of the table that contains the column.
SQL_DESC_SEARCHABLE	SQL_PRED_NONE if the column cannot be used in a WHERE clause.  SQL_PRED_CHAR if the column can be used in a WHERE clause but only with the LIKE predicate. SQL_PRED_BASIC if the column can be used in a WHERE clause with all the comparison operators except LIKE. SQL_PRED_SEARCHABLE if the column can be used in a WHERE clause with any comparison operator.
SQL_DESC_TABLE_NAME	Name of the table that contains the column.
SQL_DESC_TYPE	Numeric value that specifies the SQL data type.
SQL_DESC_TYPE_NAME	Data source-dependent data type name, for example, "CHAR".
SQL_DESC_UNNAMED	If it contains a column alias or a column name, SQL_NAMED is returned. If there is no column name or column alias, SQL_UNNAMED is returned.
SQL_DESC_UNSIGNED	SQL_TRUE if the column is unsigned (or not numeric). SQL_FALSE if the column is signed.
SQL_DESC_UPDATABLE	Updatability of the column

characterAttrPtr is a pointer to the value returned based on fieldIdentifier.

For more information, please see the SQLColAttribute function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713558(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms713558(VS.85).aspx</a>.

### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### **Example**

The following method returns the name of the second column in the Employee table:

```
$result:=ODBC_SQLPrepare($statementID; "SELECT * FROM Employee")
$result:=ODBC_SQLColAttribute($statementID; 2; SQL_DESC_LABEL; ->vColumnName)
```

### ODBC\_SQLDescribeCol

ODBC_SQLDescribeCol ( stmtlD ; colNb ; colName ; dataType ; colSize ; decimalDigits ; nullable ) -> Function result			
Parameter	Туре		Description
stmtID	Longint	$\Rightarrow$	Statement ID
colNb	Longint	$\Rightarrow$	Column number of result data
colName	String	<b>—</b>	Column name
dataType	Longint	<b>—</b>	Data type of the column
colSize	Longint	<b>—</b>	Size of the column
decimalDigits	Longint	<b>—</b>	Number of decimal digits of the column
nullable	Longint	<b></b>	Indicates if the column allows NULL values

Returns the result of the MS ODBC API function SQLDescribeCol

### **Description**

Function result

The ODBC\_SQLDescribeCol command returns the result descriptor, such as column name, type, column size, decimal digits, and nullability, for one column in the result set.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

colNb is the column number containing the result data.

Longint

colName is the name of the column.

dataType can be one of the following values:

Constant	SQL Data Type
SQL_CHAR	CHAR
SQL_VARCHAR	VARCHAR
SQL_LONGVARCHAR	LONG VARCHAR
SQL_DECIMAL	DECIMAL
SQL_NUMERIC	NUMERIC
SQL_SMALLINT	SMALLINT
SQL_INTEGER	INTEGER
SQL_REAL	REAL
SQL_FLOAT	FLOAT
SQL_DOUBLE	DOUBLE PRECISION
SQL_BIT	ВП
SQL_TINYINT	TINYINT
SQL_BIGINT	BIGINT
SQL_BINARY	BINARY
SQL_VARBINARY	VARBINARY
SQL_LONGVARBINARY	LONG VARBINARY
SQL_TYPE_DATE	Date
SQL_TYPE_TIME	Time
SQL_TYPE_TIMESTAMP	TIMESTAMP
SQL_INTERVAL_MONTH	INTERVAL MONTH
SQL_INTERVAL_YEAR	INTERVAL YEAR
SQL_INTERVAL_YEAR_TO_MONTH	INTERVAL YEAR TO MONTH
SQL_INTERVAL_DAY	INTERVAL DAY
SQL_INTERVAL_HOUR	INTERVAL HOUR
SQL_INTERVAL_MINUTE	INTERVAL MINUTE
SQL_INTERVAL_SECOND	INTERVAL SECOND
SQL_INTERVAL_DAY_TO_HOUR	INTERVAL DAY TO HOUR
SQL_INTERVAL_DAY_TO_MINUTE	INTERVAL DAY TO MINUTE
SQL_INTERVAL_DAY_TO_SECOND	INTERVAL DAY TO SECOND
SQL_INTERVAL_HOUR_TO_MINUTE	INTERVAL HOUR TO MINUTE
SQL_INTERVAL_HOUR_TO_SECOND	
SQL_INTERVAL_MINUTE_TO_SECOND	INTERVAL MINUTE TO SECOND

colSize is the size of the column.

decimalDigits is the number of decimal digits of the column.

nullable indicates if the column allows NULL values and can have one of the following values:

Constant Description

SQL\_NO\_NULLS Does not allow NULL values

SQL\_NULLABLE Allows NULL values

SQL\_NULLABLE\_UNKNOWN Driver cannot determine if the parameter allows NULL values

For more information, please see the SQLDescribeCol function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716289(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms716289(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

#### **Example**

The following method returns the name of the third column in the Employee table:

\$result:=ODBC\_SQLPrepare(\$statementID; "SELECT \* FROM Employee")
\$result:=ODBC\_SQLDescribeCol(\$statementID; 3; vColumnName; vDataType; vcolSize; vDecimalDigits; vNullable)

### ODBC\_SQLFetch

ODBC SQLFetch (stmtlD) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{stmtID} & \textbf{Longint} & \Rightarrow & \textbf{Statement ID} \\ \end{array}$ 

Function result Longint Seturns the result of the MS ODBC API function SQLFetch

#### **Description**

The ODBC SQLFetch command fetches the next rowset of data from the result set and returns data for all bound columns.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

For more information, please see the SQLFetch function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712424(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms712424(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

The following method selects all the records from the Employee table, ccreates a bind with our data source's Employee table and its four fields specified by the *ODBC\_SQLPrepare* and *ODBC\_SQLBindCol* commands, and then creates one record for each row of data in the 4D table [Employees]:

### ODBC\_SQLFetchScroll

ODBC\_SQLFetchScroll ( stmtlD ; fetchOrientation ; fetchOffset ) -> Function result

 Parameter
 Type
 Description

 stmtID
 Longint
 ⇒ Statement ID

 fetchOrientation
 Longint
 ⇒ Type of fetch

 fetchOffset
 Longint
 ⇒ Number of the row to fetch

Function result Longint Seturns the result of the MS ODBC API function SQLFetchScroll

#### **Description**

The ODBC\_SQLFetchScroll command fetches the specified rowset of data from the result set and returns data for all bound columns. Rowsets can be specified at an absolute or relative position or by bookmark.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

fetchOrientation is the type of fetch and can be one of the following types:

Constant	Description
SQL_FETCH_NEXT	Return the next rowset
SQL_FETCH_PRIOR	Return the prior rowset
SQL_FETCH_FIRST	Return the first rowset
SQL_FETCH_LAST	Return the last rowset
SQL_FETCH_ABSOLUTE	Return the rowset starting at row fetch Offset.
SQL_FETCH_RELATIVE	Return the rowset fetchOffset from the start of the current rowset
SQL_FETCH_BOOKMARK	Return the rowset fetchOffset rows from the bookmark

fetchOffset is the offset to be used when the contant SQL\_FETCH\_ABSOLUTE or SQL\_FETCH\_RELATIVE is passed to the fetchOrientation argument

For more information, please see the SQLFetchScroll function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714682(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714682(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

### ODBC\_SQLGetData

 ${\tt ODBC\_SQLGetData~(~stmtlD~;~colNb~;~targetValPtr~;~strLenOrInd~)~->~Function~result}$ 

Parameter Type Description stmtID Statement ID Longint colNb Longint Number of the column for which to return data targetValPtr Pointer Pointer to a variable in which to return the data strLenOrInd Longint Length or indicator value Returns the result of the MS ODBC API function SQLGetData Function result Longint

#### **Description**

The ODBC\_SQLGetData command retrieves data for a single column defined by colNb in the result set. It can be called multiple times to retrieve variable-length data in parts.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

colNb is the number of the column to receive the data.

targetValPtr is a pointer to the variable in which to return the data.

strLenOrInd is the length or indicator value of the value returned in targetValPtr.

For more information, please see the SQLGetData function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms715441(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms715441(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

### ODBC\_SQLGetDescField

ODBC SQLGetDescField (connectionID; recNumber; fieldIdentifier; valuePtr) -> Function result

_	•		
Parameter	Туре		Description
connectionID	Longint	$\Rightarrow$	Connection ID
recNumber	Longint	$\Rightarrow$	Descriptor record number
fieldIdentifier	Longint	$\Rightarrow$	Field of the descriptor whose value is to be returned
valuePtr	Pointer	<b>(</b>	Pointer to a variable to receive the descriptor information
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLGetDescField

#### **Description**

The ODBC\_SQLGetDescField command returns the current setting or value of a single field of a descriptor record. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

Descriptor records are numbered from 0, with record number 0 being the bookmark record. If the *fieldIdentifier* argument indicates a header field, *recNumber* is ignored. If *recNumber* is less than or equal to SQL\_DESC\_COUNT but the row does not contain data for a column or parameter, a call to *ODBC\_SQLGetDescField* will return the default values of the fields.

recNumber is the descriptor record number.

fieldIdentifier is the field of the descriptor whose value is to be returned.

valuePtr is a pointer to the variable in which to receive the descriptor information.

For more information, please see the SQLGetDescField function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716370(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms716370(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, SQL\_NO\_DATA, or SQL\_INVALID\_HANDLE. SQL\_NO\_DATA is returned if *recNumber* is greater than the current number of descriptor records.

### ODBC\_SQLGetDescRec

ODBC_SQLGetDescRec ( stmtlD ; recNumber ; name ; type ; subType ; length ; precision ; scale ; nullable ) -> Function result			
Parameter	Parameter Type		Description
stmtID	Longint	$\Rightarrow$	Statement ID
recNumber	Integer	$\Rightarrow$	Descriptor record number
name	String	<b></b>	SQL_DESC_NAME field for the descriptor record
type	Longint	<b>(</b>	SQL_DESC_TYPE field for the descriptor record
subType	Longint	<b>(</b>	SQL_DESC_DATETIME_INTERVAL_CODE field for the descriptor record
length	Longint	<b>(</b>	SQL_DESC_OCTET_LENGTH field for the descriptor record
precision	Longint	<b>—</b>	SQL_DESC_PRECISION field for the descriptor record
scale	Longint	<b>(</b>	SQL_DESC_SCALE field for the descriptor record
nullable	Longint	<b>(</b>	SQL_DESC_NULLABLE field for the descriptor record
Function result	Longint	5	Returns the result of the MS ODBC API function SQLGetDescRec

### **Description**

The ODBC\_SQLGetDescRec command returns the current settings or values of multiple fields of a descriptor record. The fields returned describe the name, data type, and storage of column or parameter data.

StmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

Descriptor records are numbered from 0, with record number 0 being the bookmark record. If the *fieldIdentifier* argument indicates a header field, *recNumber* is ignored. If RecNumber is less than or equal to SQL\_DESC\_COUNT but the row does not contain data for a column or parameter, a call to *ODBC\_SQLGetDescField* will return the default values of the fields.

recNumber is the descriptor record number.

name is the SQL\_DESC\_NAME field for the descriptor record.

type is the SQL\_DESC\_TYPE field for the descriptor record.

subType is the SQL\_DESC\_DATETIME\_INTERVAL\_CODE field for the descriptor record (for records whose type is SQL\_DATETIME or SQL\_INTERVAL).

length is the SQL\_DESC\_OCTET\_LENGTH field for the descriptor record.

precision is the SQL\_DESC\_PRECISION field for the descriptor record.

scale is the SQL DESC SCALE field for the descriptor record.

nullable is the SQL\_DESC\_NULLABLE field for the descriptor record.

For more information, please see the SQLGetDescRec function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710921(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms710921(VS.85).aspx</a>.

### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_NO\_DATA, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### ODBC\_SQLGetDiagField

ODBC_SQLGetDiagField ( handleType ; handleID ; recNb ; diagID ; diagInfoPtr ; stringLengthPtr ) -> Function result				
Parameter	Туре	Description		
handleType	Longint ⇒	Type of ID to pass to handleID		
handleID	Longint ⇒	Handle ID for the diagnostic data structure		
recNb	Longint ⇒	Indicates the status record from which the application seeks information		
diagID	Longint ⇒	Indicates the field of the diagnostic whose value is to be returned		
diagInfoPtr	Pointer 👝	Pointer to a variable in which to return the diagnostic information. The data type depends on the value of diagID		
stringLengthPtr	Pointer 🚐	Total length of the string returned in diagInfoPtr		
Function result	Longint ∋	Returns the result of the MS ODBC API function SQLGetDiagField		

#### **Description**

The ODBC\_SQLGetDiagField command returns the current value of a field of a record of the diagnostic data structure (associated with a specified *handlelD*) that contains error, warning, and status information.

handleType defines the type of ID to pass to handleID, which can be one of the following constants:

Constant	Description
SQL_HANDLE_ENV	Environment ID
SQL_HANDLE_DBC	Connection ID
SQL_HANDLE_STMT	Statement ID
SQL_HANDLE_DESC	Descriptor ID

handleID is a handle ID for the diagnostic data structure, of the type indicated by handleType. If

handle Type is SQL\_HANDLE\_ENV, this parameter is taken into account and the constant SQL\_DEFAULT\_ID can be then used.

handleID is the connectionID if handleType is equal to SQL\_HANDLE\_DBC. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

If handleType is SQL\_HANDLE\_STMT, handleID is the stmtID, which is a valid statement ID returned by ODBC\_SQLAllocStmt. recNb indicates the status record from which the application seeks information.

diagID indicates the field of the diagnostic whose value is to be returned. It can be one of the following values:

Constant	Description
SQL_DIAG_CLASS_ORIGIN	A string that indicates the document that defines the class portion of the SQLSTATE value in this record
SQL_DIAG_COLUMN_NUMBER	The column number in the result set or theparameter number in the set of parameters
SQL_DIAG_CONNECTION_NAME	A string that indicates the name of the connection that the diagnostic record relates to.
SQL_DIAG_CURSOR_ROW_COUNT	The count of rows in the cursor.
SQL_DIAG_DYNAMIC_FUNCTION	This is a string that describes the SQL statement that the underlying function executed
SQL_DIAG_DYNAMIC_FUNCTION_CODE	This is a numeric code that describes the SQL statement that was executed by the underlying function.
SQL_DIAG_MESSAGE_TEXT	An informational message on the error or warning.
SQL_DIAG_NATIVE	A driver/data source–specific native error code.
SQL_DIAG_NUMBER	Number of status records that are available
SQL_DIAG_RETURNCODE	Return code returned by the function
SQL_DIAG_ROW_COUNT	Number of rows affected by an insert, delete, or update performed by ODBC_SQLExecute, ODBC_SQLExecDirect, ODBC_SQLBulkOperations, or ODBC_SQLSetPos
SQL_DIAG_SERVER_NAME	A string that indicates the server name that the diagnostic record relates to.
SQL_DIAG_SQLSTATE	A five-character SQLSTATE diagnostic code
SQL_DIAG_SUBCLASS_ORIGIN	A string with the same format and valid values as SQL_DIAG_CLASS_ORIGIN, that identifies the defining portion of the subclass portion of the SQLSTATE code

diaglnfoPtr is a pointer to the variable in which the diagnostic information will be returned. Its type is dependent on the diaglD.

stringLengthPtr is a pointer to a variable in which to return the length of the string/text returned in diagInfoPtr.

For more information, please see the SQLGetDiagField function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710181">http://msdn.microsoft.com/en-us/library/ms710181</a>(VS.85).aspx.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, SQL\_INVALID\_HANDLE, or SQL\_NO\_DATA}.$ 

### ODBC\_SQLGetDiagRec

ODBC_SQLG	ODBC_SQLGetDiagRec ( handleType ; handleID ; recNb ; sqlState ; nativeError ; messageText ; textLength ) -> Function result				
Parameter Type Description					
handleType	Longint	⇒ Type of ID to pass to handleID			
handleID	Longint	→ Handle ID for the diagnostic data structure			
recNb	Longint	→ Indicates the status record from which information is sought. Status records are numbered from 1			
sqlState	String	⇒ Five-character SQLSTATE code pertaining to the diagnostic record recNb			
nativeError	Longint	→ Native error code, specific to the data source			
messageText	Text	□ Diagnostic message text string			
textLength	Longint	⊨ Length of the string returned in messageText			
Function result	Longint	Returns the result of the MS ODBC API function SQLGetDiagRec			

#### **Description**

The ODBC\_SQLGetDiagRec command returns the current values of multiple fields of a diagnostic record that contains error, warning, and status information. Call this command any time one of the other 4D ODBC PRO commands does not return SQL\_SUCCESS.

handleType defines the type of ID to pass to handleID, which can be one of the following:

Constant	Description	
SQL_HANDLE_ENV	Environment ID	
SQL_HANDLE_DBC	Connection ID	
SQL_HANDLE_STMT	Statement ID	
SQL_HANDLE_DESC	Descriptor ID	

handleID is a handle ID for the diagnostic data structure, of the type indicated by handleType. If handleType is SQL\_HANDLE\_ENV, this parameter is taken into account and the constant SQL\_DEFAULT\_ID can be then used.

handleID is the connectionID if handleType is equal to SQL\_HANDLE\_DBC. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

Otherwise, handleID is the stmtID, which is a valid statement ID returned by ODBC\_SQLAllocStmt.

recNb indicates the status record from which information is sought. Status records are numbered from 1.

sql/State is the five-character SQLSTATE code pertaining to recNb. The first two characters indicate the class; the next three indicate the subclass. This value comes from the SQL\_DIAG\_SQLSTATE diagnostic field.

nativeError is the native error code specific to the data source, from the SQL\_DIAG\_NATIVE diagnostic field.

messageText is the diagnostic message text string, which comes from the SQL\_DIAG\_MESSAGE\_TEXT field.

For more information, please see the SQLGetDiagRec function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms716256(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms716256(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### Example

The following method is called after the result from calling *ODBC\_SQLExecute* is not equal to SQL\_SUCCESS. The *debugMessage* variable will contain the error message:

```
If($result#SQL_SUCCESS)
   $resultDiag:=ODBC_SQLGetDiagRec(SQL_HANDLE_STMT;$statementID;1;SQLState;nativeError;
   debugMessage;vTextLen)
End if
```

### ODBC\_SQLMoreResults

ODBC\_SQLMoreResults ( stmtlD ) -> Function result

Function result Longint Square Returns the result of the MS ODBC API function SQLMoreResults

### **Description**

The ODBC\_SQLMoreResults command determines whether more results are available on a statement containing SELECT, UPDATE, INSERT or DELETE statements and, if so, initializes processing for those results.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

For more information, please see the SQLMoreResults function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714673(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms714673(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_NO\_DATA, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

### ODBC\_SQLNumResultCols

ODBC\_SQLNumResultCols ( stmtlD ; columnCount ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{stmtID} & \textbf{Longint} & \Rightarrow & \textbf{Statement ID} \\ \end{array}$ 

columnCount Longint  $\leftarrow$  Number of columns in the result set

Function result Longint Squares Returns the result of the MS ODBC API function SQLNumResultCols

#### **Description**

The ODBC\_SQLNumResultCols command returns the number of columns in a result set.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

columnCount is the number of columns in the result set. It does not include a bound bookmark column.

For more information, please see the SQLNumResultCols function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms715393(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms715393(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

### ODBC\_SQLRowCount

ODBC\_SQLRowCount ( stmtlD ; rowCount ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \text{stmtID} & \text{Longint} & \Rightarrow & \text{Statement ID} \end{array}$ 

rowCount Longint 

Number of rows affected by the request

Function result Longint Squares the result of the MS ODBC API function SQLRowCount

#### **Description**

The ODBC\_SQLRowCount command returns the number of rows affected by an UPDATE, INSERT, or DELETE statement; an SQL\_ADD, SQL\_UPDATE\_BY\_BOOKMARK, or SQL\_DELETE\_BY\_BOOKMARK operation in ODBC\_SQLBulkOperations; or an SQL\_UPDATE or SQL\_DELETE operation in ODBC\_SQLSetPos.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

rowCount is the number of rows affected by the result set.

For more information, please see the SQLRowCount function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms711835(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms711835(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### Example

See the example for the ODBC SQLBulkOperations command.

### ODBC\_SQLSetDescField

ODBC_SQLSetDescField ( connectionID ; recNumber ; fieldIdentifier ; valuePtr ) -> Function result			
Parameter	Type		Description
connectionID	Longint	$\Rightarrow$	Connection ID
recNumber	Longint	$\Rightarrow$	Descriptor record number
fieldIdentifier	Longint	$\Rightarrow$	Field of the descriptor whose value is to be set
valuePtr	Pointer	$\Rightarrow$	Pointer to the value to set fieldIdentifier

Returns the result of the MS ODBC API function SQLSetDescField

#### **Description**

Function result

The ODBC\_SQLSetDescField command sets the value of a single field of a descriptor record.

connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

Descriptor records are numbered from 1, with *recNumber* equal to 0 being the bookmark record. The *recNumber* argument must be less than or equal to the value of SQL\_DESC\_COUNT. If *recNumber* is less than or equal to SQL\_DESC\_COUNT but the row does not contain data for a column or parameter, a call to *ODBC\_SQLSetDescField* will return the default values of the fields.

recNumber is the descriptor record number.

fieldIdentifier is the field of the descriptor whose value is to be set.

valuePtr is a pointer to the variable to set fieldIdentifier.

Longint

For more information, please see the SQLSetDescField function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713560(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms713560(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### ODBC\_SQLSetDescRec

ODBC\_SQLSetDescRec (stmtlD; recNumber; type; subType; length; precision; scale; dataPtr; stringLengthPtr; indicatorPtr) -> Function result

1 dilotion roodit			
Parameter	Type		Description
stmtID	Longint	$\Rightarrow$	Statement ID
recNumber	Integer	$\Rightarrow$	Descriptor record number
type	Integer	$\Rightarrow$	SQL_DESC_TYPE field for the descriptor record
subType	Integer	$\Rightarrow$	SQL_DESC_DATETIME_INTERVAL_CODE field for the descriptor record
length	Integer	$\Rightarrow$	SQL_DESC_OCTET_LENGTH field for the descriptor record
precision	Integer	$\Rightarrow$	SQL_DESC_PRECISION field for the descriptor record
scale	Integer	$\Rightarrow$	SQL_DESC_SCALE field for the descriptor record
dataPtr	Pointer	$\Rightarrow$	SQL_DESC_DATA_PTR field for the descriptor record
stringLengthPtr	Pointer	$\Rightarrow$	SQL_DESC_OCTET_LENGTH_PTR field for the descriptor record
indicatorPtr	Pointer	$\Rightarrow$	SQL_DESC_INDICATOR_PTR field for the descriptor record
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLSetDescRec

### **Description**

The ODBC\_SQLSetDescRec command sets multiple descriptor fields that affect the data type and buffer bound to a column or parameter data.

StmtID is a valid statement ID returned by ODBC SQLAllocStmt.

Descriptor records are numbered from 1, with *recNumber* equal to 0 being the bookmark record. The *recNumber* argument must be less than or equal to the value of SQL\_DESC\_COUNT. If *recNumber* is less than or equal to SQL\_DESC\_COUNT but the row does not contain data for a column or parameter, a call to *ODBC\_SQLSetDescRec* will return the default values of the fields.

recNumber is the descriptor record number.

type is the SQL\_DESC\_TYPE field for the descriptor record.

subType is the SQL\_DESC\_DATETIME\_INTERVAL\_CODE field for the descriptor record (for records whose type is SQL\_DATETIME or SQL\_INTERVAL).

length is the SQL\_DESC\_OCTET\_LENGTH field for the descriptor record.

 $\textit{precision} \ \text{is the SQL\_DESC\_PRECISION} \ \text{field for the descriptor record}.$ 

scale is the SQL\_DESC\_SCALE field for the descriptor record.

dataPtr is the SQL\_DESC\_DATA\_PTR field for the descriptor record.

stringLengthPtr is the SQL\_DESC\_OCTET\_LENGTH\_PTR field for the descriptor record.

indicatorPtr is the SQL\_DESC\_OCTET\_INDICATOR\_PTR field for the descriptor record.

For more information, please see the SQLSetDescRec function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714675">http://msdn.microsoft.com/en-us/library/ms714675</a>(VS.85).aspx.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### ODBC\_SQLSetPos

ODBC_SQLSetPos ( stmtlD ; rowNb ; operation ; lockType ) -> Function result					
Parameter	Туре	Description			
stmtID	Longint =	⇒ Statement ID			
rowNb	Longint =	Position of the row in the rowset on which to perform the operation specified with the operation argument			
operation	Longint =	Operation to perform			
lockType	Longint =	Specifies how to lock the row after performing the operation			
Function result	Longint 5	Returns the result of the MS ODBC API function SQLSetPos			

### **Description**

The ODBC\_SQLSetPos command sets the cursor position in a rowset and allows an application to refresh data in the rowset or to update or delete data in the result set.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

rowNb is the position of the row in the rowset on which to perform the operation specified with the operation argument. If 0, then the operation applies to every row in the rowset.

operation is the operation to perform and can be one of the following constants:

Constant	Value	Description
SQL_POSITION	0	Driver positions the cursor on the row specified by rowNb
SQL_REFRESH	1	Driver positions the cursor on the row specified by rowNb and refreshes data in the rowset for that row
SQL_UPDATE	2	Driver positions the cursor on the row specified by <i>rowNb</i> and updates the underlying row of data with the values in the row set
SQL_DELETE	3	Driver positions the cursor on the row specified by rowNb and deletes the underlying row of data

*lockType* specifies how to lock the row after performing the operation:

Constant	Value	Description
SQL_LOCK_NO_CHANGE	0	Driver or data source ensures that the row is in the same locked or unlocked state as it was before <b>ODBC_SQLSetPos</b> was called
SQL_LOCK_EXCLUSIVE	1	Driver or data source locks the row exclusively
SQL_LOCK_UNLOCK	2	Driver or data source unlocks the row

For more information, please see the SQLSetPos function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713507">http://msdn.microsoft.com/en-us/library/ms713507</a>(VS.85).aspx.

### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NEED\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

# ODBC\_Submit requests

- Submitting Requests
- ODBC\_SQLDescribeParam
- ODBC\_SQLExecDirect
- ODBC\_SQLExecute
- ODBC\_SQLNativeSql
- ODBC\_SQLNumParams
- ODBC\_SQLParamData
- ODBC\_SQLPutData

### Submitting Requests

The commands in this chapter enable you to submit SQL requests, by allowing you to do the following:

- Retrieve the description of a parameter associated with a prepared SQL statement (ODBC\_SQLDescribeParam)
- Execute a statement, using the current values of the parameter marker variables if any parameters exist in the statement that you
  pass directly to it (ODBC\_SQLExecDirect)
- Execute a prepared statement, using the current values of the parameter marker variables if any parameter markers exist in the statement (ODBC\_SQLExecute)
- Return the SQL string as modified by the driver but do not execute the SQL statement (ODBC\_SQLNativeSQL)
- Obtain the number of parameters in an SQL statement (ODBC\_SQLNumParams)
- Supply parameter data at statement execution time before calling ODBC\_SQLPutData (ODBC\_SQLParamData)
- Send data for a parameter or column to the driver (ODBC\_SQLPutData)

### ODBC\_SQLDescribeParam

ODBC_SQLDescribeParam ( stmtlD ; paramNb ; dataType ; paramSize ; decimalDigits ; nullable ) -> Function result					
Parameter	Туре	Description			
stmtID	Longint ⇒	Statement ID			
paramNb	Longint ⇒	Parameter marker number ordered sequentially in increasing parameter order, starting at 1			
dataType	Longint 👝	SQL data type of the parameter			
paramSize	Longint 👝	Size of the column or expression of the corresponding parameter marker as defined by the data source			
decimalDigits	Longint 👝	Number of decimal digits of the column or expression of the corresponding parameter as defined by the data source			
nullable	Longint 👝	Indicates whether the parameter allows NULL values			
Function result	Longint $\supset$	Returns the result of the MS ODBC API function SQLDescribeParam			

#### **Description**

The ODBC\_SQLDescribeParam command returns the description of a parameter associated with a prepared SQL statement. stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

paramNb is the parameter marker number ordered sequentially in increasing parameter order, starting at 1.

dataType is the SQL data type of the parameter. See the *ODBC\_SQLGetTypeInfo* command for possible data types. paramSize is the size of the column or expression.

decimalDigits is the number of decimal digits of the column or expression.

The nullable parameter indicates whether the parameter allows NULL values and can be equal to one of the following values:

Constant	Description
SQL_NO_NULLS	Does not allow NULL values
SQL_NULLABLE	Allows NULL values
SQL_NULLABLE_UNKNOWN	Driver cannot determine if the parameter allows NULL values

For more information, please see the SQLDescribeParam function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms710188(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms710188(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or {\tt SQL\_INVALID\_HANDLE}.}$ 

### ODBC\_SQLExecDirect

ODBC\_SQLExecDirect ( stmtlD ; stmtText ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{stmtID} & \textbf{Longint} & \Rightarrow & \textbf{Statement ID} \\ \end{array}$ 

Function result Longint Seturns the result of the MS ODBC API function SQLExecDirect

#### **Description**

The ODBC\_SQLExecDirect command executes a preparable statement, using the current values of the parameter marker variables if any parameters exist in the statement.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

stmtText is an SQL statement to be executed.

For more information, please see the SQLExecDirect function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713611(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms713611(VS.85).aspx</a>.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NEED\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, SQL\_NO\_DATA, or {\tt SQL\_INVALID\_HANDLE}.}$ 

#### **Example**

See the example for the ODBC\_SQLGetCursorName command.

### ODBC\_SQLExecute

ODBC SQLExecute (stmtlD) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \textbf{stmtID} & \textbf{Longint} & \Rightarrow & \textbf{Statement ID} \end{array}$ 

Function result Longint Squares Returns the result of the MS ODBC API function SQLExecute

#### **Description**

The ODBC\_SQLExecute command executes a prepared statement, using the current values of the parameter marker variables if any parameter markers exist in the statement.

stmtID is a valid statement ID returned by ODBC SQLAllocStmt.

For more information, please see the SQLExecute function in the MS ODBC API Reference at http://msdn.microsoft.com/en-us/library/ms713584(VS.85).aspx.

#### **Function Results**

 ${\tt SQL\_SUCCESS\_WITH\_INFO, SQL\_NEED\_DATA, SQL\_STILL\_EXECUTING, SQL\_ERROR, SQL\_NO\_DATA, or {\tt SQL\_INVALID\_HANDLE}.}$ 

If ODBC SQLExecute returns SQL NEED DATA, you can use the ODBC SQLParamData and ODBC SQLPutData commands.

#### **Example**

The following method creates a bind with our data source's Employee table and its four fields specified by the *ODBC\_SQLPrepare* command and then inserts the data defined in the *ODBC\_SQLBindParameter* command once the statement is executed:

```
$result:=ODBC_SQLPrepare($statementID;"INSERT INTO Employee (ID, Name, Hire_Date,
Current_Employee) VALUES(?,?,?,?)")

vEmployeeHireDate:=Current date
vEmployeeFullname:="Betty Jones"
vEmployeeFullname:="Betty Jones"
vEmployeeCurrent:=True

$result:=ODBC_SQLBindParameter($statementID;1;1;SQL_SMALLINT;0;0;->vEmployeeID)
$result:=ODBC_SQLBindParameter($statementID;2;1;SQL_CHAR;10;0;->vEmployeeFullname)
$result:=ODBC_SQLBindParameter($statementID;3;1;SQL_TYPE_DATE;0;0;->vEmployeeHireDate)
$result:=ODBC_SQLBindParameter($statementID;4;1;SQL_BIT;0;0;->vEmployeeCurrent)

$result:=ODBC_SQLBindParams($statementID;$numparams)
$result:=ODBC_SQLExecute($statementID;$numparams)
$result:=ODBC_SQLExecute($statementID)
```

### ODBC\_SQLNativeSql

ODBC\_SQLNativeSql ( connectionID ; inStatementText ; outStatementText ) -> Function result

 Parameter
 Type
 Description

 connectionID
 Longint
 ⇒
 Connection ID

 inStatementText
 Text
 ⇒
 SQL text string to be translated

 outStatementText
 Text
 ⇒
 Translated SQL string

 Function result
 Longint
 ⇒
 Returns the result of the MS ODBC API function SQLNativeSql

#### **Description**

The ODBC\_SQLNativeSql command returns the SQL string as modified by the driver but does not execute the SQL statement. connectionID is a valid connection ID returned by ODBC\_SQLAllocConnect and a connection must be established using the ODBC\_SQLConnect command.

inStatementText is the SQL text string to be translated.

outStatementText is the translated SQL string.

For more information, please see the SQLNativeSql function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms714575">http://msdn.microsoft.com/en-us/library/ms714575</a>(VS.85).aspx.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### ODBC\_SQLNumParams

ODBC\_SQLNumParams ( stmtlD ; parameterCount ) -> Function result

 $\begin{array}{cccc} \textbf{Parameter} & \textbf{Type} & \textbf{Description} \\ \text{stmtID} & \text{Longint} & \Rightarrow & \text{Statement ID} \end{array}$ 

parameterCount Longint 

Number of parameters in the statement

Function result Longint SQLNumParams Returns the result of the MS ODBC API function SQLNumParams

#### **Description**

The ODBC\_SQLNumParams command returns the number of parameters in an SQL statement.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

parameterCount is the number of parameters in the statement specified by stmtlD.

For more information, please see the SQLNumParams function in the MS ODBC API at <a href="http://msdn.microsoft.com/en-us/library/ms715409(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms715409(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

### **Example**

See the example for the ODBC SQLExecute command.

### ODBC\_SQLParamData

ODBC\_SQLParamData ( stmtlD ; valuePtr ) -> Function result

valuePtr Pointer — Pointer to the parameter data or column data

Function result Longint Seturns the result of the MS ODBC API function SQLParamData

#### **Description**

The ODBC\_SQLParamData command is used in conjunction with ODBC\_SQLPutData to supply parameter data at statement execution time.

stmtID is a valid statement ID returned by ODBC\_SQLAllocStmt.

valuePtr is equal to paramValPtr passed to ODBC\_SQLBindParameter (for parameter data) or targetValuePtr passed to ODBC\_SQLBindCol (for column data).

For more information, please see the SQLParamData function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms712366(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms712366(VS.85).aspx</a>.

#### **Function Results**

SQL\_SUCCESS, SQL\_SUCCESS\_WITH\_INFO, SQL\_STILL\_EXECUTING, SQL\_ERROR, or SQL\_INVALID\_HANDLE.

#### **Example**

See the example for the ODBC SQLPutData command.

### ODBC\_SQLPutData

ODBC_SQLPutData ( stmtlD ; valuePtr ; strLenOrInd ) -> Function result				
Parameter	Туре		Description	
stmtID	Longint	$\Rightarrow$	Statement ID	
valuePtr	Pointer	$\Rightarrow$	Pointer to the actual data for the parameter or column	
strLenOrInd	Longint	$\Rightarrow$	Amount of data to send	
Function result	Longint	Þ	Returns the result of the MS ODBC API function SQLPutData	

#### **Description**

The ODBC\_SQLPutData command sends data for a parameter or column to the driver at statement execution time.

stmtlD is a valid statement ID returned by ODBC\_SQLAllocStmt.

valuePtr is a pointer to the data for the parameter or column.

strLenOrInd is an optional parameter that defines the amount of data to send if paramType is of type Text, Picture, or BLOB. Use the ODBC LenDataAtExec command to convert the actual length so that it can be processed by the MS ODBC API.

For more information, please see the SQLPutData function in the MS ODBC API Reference at <a href="http://msdn.microsoft.com/en-us/library/ms713824(VS.85).aspx">http://msdn.microsoft.com/en-us/library/ms713824(VS.85).aspx</a>.

#### **Function Results**

SQL SUCCESS, SQL SUCCESS WITH INFO, SQL STILL EXECUTING, SQL ERROR, or SQL INVALID HANDLE.

#### **Example**

The following method creates a bind with our data source's Employee table and inserts data into its four fields. If ODBC\_SQLPrepare command returns SQL\_NEED\_DATA, we find out which parameter need data by calling ODBC\_SQLParamData and insert a value using ODBC\_SQLPutData:

```
vIndic:=ODBC LenDataAtExec(5)
$result:=ODBC SQLPrepare($stmtID;"INSERT INTO Employee (ID, Name, Hire_Date, Current_Employee)
VALUES(?,?,?,?)")
vEmployeeHireDate:=Current date
vEmployeeID:=6
vEmployeeFullname:=""
vEmployeeCurrent:=True
$result:=ODBC SQLBindParameter($statementID;1;1;SQL SMALLINT;0;0;->vEmployeeID)
$result:=ODBC SQLBindParameter($statementID;2;1;SQL CHAR;10;0;->vEmployeeFullname;->vIndic)
$result:=ODBC SQLBindParameter($statementID; 3; 1; SQL TYPE DATE; 0; 0; ->vEmployeeHireDate)
$result:=ODBC SQLBindParameter($statementID;4;1;SQL BIT;0;0;->vEmployeeCurrent)
$result:=ODBC SQLExecute($stmtID)
While ($result=SQL NEED DATA)
  $result:=ODBC SQLParamData($stmtID;vWhichField)   `Returns a pointer to the expected
  vWhichField->:="More data needed"
  $result:=ODBC SQLPutData($stmtID;vWhichField)
End while
```

# **Appendixes**

- Appendix A, 4D ODBC PRO Error Codes
- Appendix B, 4D ODBC PRO Constants

## 🚁 Appendix A, 4D ODBC PRO Error Codes

This section describes all the error codes returned by 4D ODBC PRO:

Constant	Value
SQL_ERROR	-1
SQL_INVALID_HANDLE	-2
SQL_NEED_DATA	99
SQL_NO_DATA	100
SQL_STILL_EXECUTING	2
SQL_SUCCESS	0
SQL_SUCCESS_WITH_INFO	1

This section details all of the SQL constants that can be used in 4D ODBC PRO.

**Important Note**: In the current release of the 4D ODBC PRO plug-in, not all of the following SQL constants are available as such, but you can still use the associated value. In the list below, the constants that have not been created are followed by a \* sign.

you can still use the associated value. In the list below,	
Constant	Value
